Identifiers: *Environmental quality, *National policy, *Laissez-faire, Tax surplus, Free market, Budget, Housing.

The article discusses the need for indicators of environmental quality to be built into the national public reporting system at the Presidential level since the Federal Government has the greatest freedom from fiscal constraint in its initiatives. The factor of political expediency is suggested to be a mainspring of the technology through which things get done about air and water pollution, pesticides, urban transport, flights, floods, and the like. The contenders for a share in Federal political expediency actions in the area of environmental control are primarily the Housing and Urban Development Department, and the Departments of Health, Education and Welfare, Commerce, The Interior, Agriculture, and Labor. Action at the Federal level can result in regionalized areas and staffs which act as the arm for Presidential field coordination, thus permitting regional problems to be dealt with most effectively, whether of a metropolitan, a watershed, or a drainage difficulty. Another possibility would be internalizing the costs of some problems, such as controlling pollution, to industry, with Federal supervision. Improving the quality of the environment can be achieved part-way by the leadership and fiscal aid of Washington, and complemented by metropolitan and/or regional government action. (Murphy-Rutgers)

A REINTERPRETATION OF THE PURE THEORY OF EXHAUSTION,
Pennsylvania State Univ., University Park.
Richard L. Gordon.
Jour Pol Econ, Vol 75, No 3, p 274-286, June 1967. 13 p, 12 ref, 1 append.

Descriptors: *Natural resources, *Profit, Competition, Costs, Prices, Conservation, Technology, Monopoly, Equilibrium, Constraints, Interest rate.

Eventual exhaustion of natural resources is often regarded as a serious economic problem, but the theory of the subject remains somewhat inadequate. A more comprehensive model generalizing prior analyses and re-evaluating the empirical implications of the theory is needed. Extensions are also required to analyze the vital distinction between optimal centralized management and the collective behavior of separate firms in a competitive industry. The literature is reviewed and a theoretical model developed which incorporates most prior analyses as special cases. At this stage it is assumed that only current output affects profits. Later the more general case in which past production also influences current profits is considered. The difficulties in developing a general industry model are also discussed. This section neglects the complication produced by the effects of past production on profits, and relates existing models to industry analysis. A model using linear cost and demand functions to show that efficient social decision making can produce different results from private, competitive behavior is developed in the appendix. Much of what is derived here for any natural resource could be applied to problems in water resources management. (Sokoloff-Rutgers)

CONCERNING EVALUATION OF NATURAL RESOURCES,
lu Sukhotin.
Problems of Economics, Vol XI, No 2, p 29-39, June 1968. 11 p, 1 tab.

Descriptors: *Natural resources, Water resources, Water pollution, Productivity, Profit, Legal aspects, Administrative decisions, Value, Rent, Industrial wastes, Compensation, Linear programming.
Identifiers: *Economic evaluation, *Complete cost accounting, *Accounting price, *USSR, Socially necessary expenditures.

One of the most complex problems is the economic evaluation and organization of cost accounting relations with respect to water resources since joint use is made of them. The use of water can be on a returnable basis (for example, electric power stations) and also on a non-returnable basis. The largest consumer of water on a non-returnable basis at the present time is agriculture. If non-returnable consumption by any user of water does not reduce the water supply of the remaining users, a given source of water is not as yet a limited resource and does not have an economic evaluation. However, in many regions users of water must pay for non-returnable consumption according to the outlays required for replacement. If this consumption results in (for example) poorer navigation conditions, outlays for replacement take the form of additional outlays for shipping part of the goods by other means of transport. Pollution is one of the most serious factors in the increasing dimunition of water resource. As a result of pollution, various types of compensatory outlays must be made. The entire sum of these additional national economic costs must be fully compensated for by the enterprises contaminating the water. This article could be useful in a comparative study of the economic evaluation of water resources. (Sokoloff-Rutgers)

A UTILITY MEASURE BASED ON TIME PREFERENCE,
Dayton, Ohio.
Hermann Enzer.
Econ Jour, Vol LXXVIII, No 312, p 888-897, Dec 1968. 10 p, 7 ref.

Descriptors: *Cost-benefit analysis, Water supply, Public benefits, Probability.
Identifiers: *Public projects, *Ordinal utility function, *Time preference, Market prices, Subjective measures, Ordering, Public goods, Mathematical expectations.

In a recent survey Prest and Turvey discussed the applications of cost-benefit analysis to such public projects as water supply, transportation, health and education, and defense. Lack of emphasis on these areas is due to the fact that cost-benefit analysis when applied to these areas, is essentially only cost analysis. The author endeavors to seek a utility measure for the set of items that do not have market prices and for which none may be derived or imputed, such as in the case of water-supply projects. One cannot fall back on an ordinal utility measure and derive anything better than a ranking precisely because there are no market prices. The author believes that any attempt to improve upon the necessarily subjective measures that are usually applied might be worth the effort. A utility measure is suggested which, in certain circumstances may provide reasonable approximations to the relative utilities of a set of items that do not possess market prices. As in the case of other measures that have been constructed, such as the von Neumann-Morgenstern measure, or the Pareto-Lange approach of comparing utility differences, some of the assumptions made are questionable. The author believes that his approach is an improvement over some of the other utility measures which have been defined on orderings of items that may not have market prices. (Sokoloff-Rutgers)

THE MEASUREMENT OF UTILITY,
Case Western Reserve Univ., Cleveland, Ohio.
C. Hillinger.
Rev Econ Studies, Vol XXXVI (1), No 105, p 111-116, Jan 1969. 7 p, 4 ref.

Descriptors: *Marginal utility, *Elasticity of demand, Consumptive use.
Identifiers: *Utility maximization, *Income elasticities, *Intertemporal allocation, Relative prices, Econometric studies, Demand function, Luxury goods, Mean value theorem.

This paper shows how the utility levels attained by a consumer may be measured exactly under idealized conditions. These conditions include knowledge of the trajectories of prices, income, and quantities, and of the numerical magnitudes of certain elasticities. This approach provides a ranking for all consumption vectors on the trajectory. An analytical expression is given, showing the effects on the marginal utility of income of changes in income and in relative prices. These effects depend on the income elasticities of commodities and on the income elasticity of the marginal utility of income. This provides a link between a number of concepts and parameters in consumer theory. The result also lends itself to empirical application. Estimates of the demand elasticities are available from many econometric studies. The less well known elasticity of the marginal utility of income plays a role in intertemporal utility maximization. It is shown how this may be estimated following Samuelson, by using data on total consumption expenditures over time. The ability to derive a grand utility function would aid policymakers in the optimum allocation of resources. These decisions could include important water resources allocation problems. COST-BENEFIT ANALYSIS: A SURVEY,
Manchester Univ. (England).
A. R. Prest, and R. Turvey.
The Economic Journal Vol 75, No 300, p 683-735, December 1965. 53 p, 2 fig, 90 ref.

Descriptors: *Project planning, *Cost-benefit analysis, Benefits, Welfare economics, Financing, Resources, Flood-control, Investment, Indirect benefits, Irrigation, Project life, Prices, Supply, mand, Wages, Taxes, Government, Interest r Budgeting, Value, Roads, Recreation, Transpo tion.
Identifiers: *Hydroelectric power, Savings, Wa ways.

Cost-benefit analysis, as a practical way of sessing the desirability of projects is of vital portance in the water resource area. In this art the authors provide a general survey of the en area of benefit-cost analysis. The first section lines the development and scope of this type analysis. The second section deals with the gen principles of benefit-cost study. The next sec provides a survey of the applicability of the anal to various fields. Included here is the discussio its applicability to water resource projects with ticular regard to flood control, irrigation hydroelectric power. In the last section the are benefit-cost analysis is reviewed within the prec ing framework. The conclusion points out the ficulties of evaluation, especially on the benefit of the analysis but notes the significant usefuln in the area of project evaluation. (Murphy-R gers)

ptors: *Water pollution control, *Optimiza- Systems analysis, Economics, Costs, Low-flow augmentation, Reaeration, Oxygen demand, Taxes, Cost analysis.
Identifiers: Pollution abatement costs.

A systems analysis study was made of the relationship between pollution-charge tax income and the costs of augmentation of waste assimilative capacity, with both set to maximize benefits to rivers. Parametric cost functions for several waste treatment technologies are derived. It is concluded that low-flow augmentation coupled with optimal-level pollution changes will probably generate substantial financial surpluses, while artificial aeration will probably break even or generate a small deficit. NATURAL-GAS-PIPELINE RATE REGULATION: MARGINAL-COST PRICING AND THE ZONE-ALLOCATION PROBLEM,
Laurence C. Rosenberg.
Jour Pol Econ, Vol 75, No 2, p 159-168, Apr 1967. 10 p, 3 fig, 4 tab, 9 ref.

Descriptors: *Utilities, Natural gas, Peak loads, Consumptive use, Variable costs.
Identifiers: *Regulatory policy, *Federal Power Commission, *Zone-cost-allocation method, optimal rate structure, Atlantic Seaboard formula, Capacity costs.

Criticism of regulatory policy of gas and electric utilities is often based on a finding that rate-making procedures tend to cause prices to deviate from marginal costs such that peak-period users pay too little and off-peak users pay too much. Federal Power Commission (FPC) regulation of natural-gas pipelines may also result in a similarly defective rate structure, the result of which may be to inhibit utilization of existing plant and to construct too much capacity. The two necessary conditions to make such a criticism have not been adequately established, that is, what is an optimal rate structure and how do current practices deviate from it. For a sufficient analysis, peak-and off-peak period pricing must be considered along with the zone-cost-allocation problems that arise from the fact that pipeline customers are located at varying distances from the source of gas and are charged according to the zone to which they are assigned. This article extends the theory of peak-responsibility pricing based on marginal costs to include zone allocation and to evaluate FPC policy for its consistency with the results of the theoretical analysis. Both the peak-load pricing and zone allocation aspects of this article would have relevance for water pricing policy in certain locations. (Sokoloff-Rutgers)

SIDE EFFECTS OF RESOURCE USE,
Electricity Council, London (England).
Ralph Turvey.
IN Environmental Quality in a Growing Economy, Baltimore, The Johns Hopkins Press, 1966. p 47-60, 14 p, 12 ref. Henry Jarrett, Editor.

Descriptors: *Economic justification, *Resource allocation, *Pollution, *Economics, *Technology, Taxes, Fisheries, Fish stocking, Subsurface water, Water supply, Prices, Costs, Land, Wells, Rivers, Sewage, Marketing, Roads, Powerline carriers.
Identifiers: *External diseconomies, *Regulation, *Calculations, Water reserves, Criterion, Temperature, Brickworks, Noise.

The article is concerned with a consideration of the neglected side effects of the use of natural resources on the quality of the environment. These side effects, or external economies and diseconomies, are relationships in the market other than those between buyer and seller. To illustrate this concept, seven examples are used which give both reciprocal and/or unidirectional impacts. These examples are fisheries, traffic flow, wells, jet noise, river pollution, visual aesthet ics and cattle poisoning. Where side effects are involved, as in these cases, the market mechanism alone may not produce the best possible allocation of resources. Reduction of the adverse consequences of external effects is a multi-dimensional problem: who should do what and how much. To answer this, the economic criterion used should be that the present value of the monetary measure of all gains from modifying activities less the present value of the monetary measure of all losses from these modifications be maximized. Regulation is another possible solution, as is a tax. At any rate, each case must be individually weighed, alternatives should be considered, and it should be remembered that questions of fairness require legal or political decisions. (Murphy-Rutgers)

THE SOCIAL TIME PREFERENCE DISCOUNT RATE IN COST-BENEFIT ANALYSIS,
Nuffield Coll., Oxford (England).
M. S. Feldstein.
The Economic Journal, Vol 74, No 294, p 360-379, Jun 1964. 20 p, 16 ref.

Descriptors: *Cost-benefit analysis, *Costs, Interest rate, Discount rate, Capital, Income, Demand, Government, Consumption, Fixed costs, Economics, Rates.
Identifiers: *Social time preference, *S T P rate, Capital market, Rate of return, Opportunity costs.

In this paper the author finds that the social time preference function cannot be derived on the basis of existing market rates, but must be administratively determined as a matter of public policy. As a subtopic in the area of benefit-cost analysis this article, with its concentration on the problems of public goods, is of particular interest to the water resource planner. The article examines the characteristics of the social time preference (S.T.P.) function, its relation to the S.T.P. rate and the movement of the S.T.P. rate through time. The article concludes with several recommendations for more effective decisions in the public investment area. (Murphy-Rutgers)

Identifiers: *Public investment programs, *General equilibrium analysis, Empirical data, Final demand, Sector, Interindustry transactions, Dual problem.

In scope this study considers both the methodology and the limitations of the linear programming model as a planning and decision-making goal. An interindustry model for the State of California is constructed based on national and secondary data sources for the year 1958. The model is aggregated to a representative number of sectors for which water-use data could be obtained and formulated as a linear programming model for which typical fresh water withdrawal constraints could be changed parametrically. A time series for Gross State Product was developed for 1940 to 1966 in 1958 constant dollars and growth projections were made to the year 1990. Ranges of final demands for the model were set and solutions obtained so as to maximize Value Added given different levels of fresh water availability. Minimal levels of water required were determined and estimates made that would satisfy the specified demands fully. The dual solutions of the linear program were noted as the water constraints were changed and the shadow prices for water were determined for different levels of water availability. ROAD PRICING,
London School of Economics and Political Science (England).
A. A. Walters.
De Economist, Vol 116, No 5, p 545-60, Sept/Oct, 1968. 17 p, 1 tab.

Descriptors: *Pricing, Gasoline, Taxes, Capital costs, Financing, Rent, Queuing theory, Urbanization.
Identifiers: *User charges, *Congestion costs, *Social costs, Market forces, Scarcity, Traffic level, Road space, Subsidies, Public transport.

Among the main problems in the public sector of the economy are those of road congestion on the one hand and under-utilization of roads on the other. This is partly a consequence of inefficient price policies for the use of roads. But road pricing involves many technical and distributional problems. A preliminary survey of the effects suggests that quite simple road pricing systems, such as a differentiated urban-rural license fee, may be a most efficient way of introducing road pricing. Tolls on critical access points may be another efficient way of introducing congestion charges. At the same time it is important to attempt to reduce charges on uncongested roads, and this is especially necessary for developing countries. A preliminary survey of the effects of such a rearrangement of road taxation suggests that there would be no market redistributional effects. But much more work is required on this aspect of road pricing. This analysis has some application to pricing and taxation policy for water resources, especially in cases where there are many competing demands on an inadequate fixed supply, that is not easily augmentable. COST AND REVENUE ASSOCIATED WITH INCREASED SALES OF TVA POWER,
Missouri Univ., Columbia.
Richard L. Wallace.
Southern Econ Jour, Vol XXXIII, No 4, p 526-534, April 1967. 9 p, 5 tab.

Descriptors: *Tennessee Valley Authority Project, *Power marketing, Peak loads, Transmission (Electric), Alternative costs, Pricing, Economies of scale, Economic efficiency, Resource allocation, Investment, Interest rate.
Identifiers: *Capacity costs, *Energy costs, Social cost, Wholesale rate structure, Asset life, Stream plants, Production costs, Annual load growth, Revenue.

The purpose of this paper is to determine whether TVA's wholesale rates are consistent with the goal of efficient resource allocation. Since this goal requires prices that reflect the social cost of supplying additional power, the costs of providing for annual load growth, as it has occurred under TVA's rate structure, are compared to the increases in revenue for which the additional power is supplied. Cost and revenue estimates are compared for overall annual increases in TVA load and for annual increases in the loads of each of the three classes of TVA customers (municipal and cooperative distributors, 36 large industrial firms served directly by TVA, and other federal agencies). In addition, the cost imposed on TVA when a new all-electric home is added to a distributor's lines is compared to the increase in revenue received by TVA from the distributor for power resold to this customer. This comparison is made because of the important contribution of electric heat to the system peak. This article may have some applicability in deciding pricing policies for water resources. Descriptors: *Inter-basin transfer, Negotiation, Cost allocation, Economics, Water resources development.
Identifiers: Political processes, Public policy, Bargaining, National interest.

This paper characterizes the political processes through which inter-basin transfer decisions are made and identifies some of the basic public policy issues in this area. The political process involves negotiation and bargaining among groups--some with interests primarily in the region of water origin, some with interests primarily in the region receiving the supply, some with a major interest in development programs, and some with a national interest. These groups adopt strategies and make demands in accord with their respective interests. In view of the high cost of water transfers, public action requires a strategy which achieves an acceptable distribution of costs and returns among the bargaining groups, a unified effort on the part of those who will benefit, and avoiding behavior and plans that will needlessly arouse opposition. Three major policy issues are identified: (1) Will realistic alternatives for meeting demands for water and water services be examined in the bargaining process; (2) Will all groups affected by a proposed transfer be represented in the decision with regard to a proposed transfer; (3) How will the costs of the transfer be shared. s: *Sociological research, *Residential Scale of attitudes, *Community action, nnaires, *Mean water use curve, *Demo-haracteristics.

This nation required only 40 billion gallons of water daily in 1900, but by 1965 it required 360 billion gallons a day, an increase of more than threefold in the use per capita. As the standard of living increases it is expected that the strains on the adequate and high-quality water supply will increase. Literature on community action can be combined with those few studies which pertain to watershed acceptance patterns among populations concerned, in order to supply the basis for social science analysis. Such a combination may provide enough data to suggest some policy recommendations regarding water resource conservation for specific communities. The purpose of this study is to determine what relationships there are between water consumption in residential areas, as compared with certain designated demographic and social characteristics of the population. The study aims at discovering some set of basic attitudes to water consumption, conservation and waste with the goal of unraveling the underlying values about water as a commodity. (Sokoloff-Rutgers)

GROUNDWATER--A NEGLECTED RESOURCE,
Geraghty and Miller, Port Washington, N.Y.
James J. Geraghty.
Jour American Water Works Assoc, Vol 59, No 7, p 820-828, July 1967. 9 p, 5 fig, 1 ref.

Descriptors: *Groundwater, *Geologic formations, Coastal plains, Pumping, Natural recharge, Salinity.
Identifiers: *Natural reservoirs, Freshwater reserves, Utilization, Temperature variations, Wastes contamination.

When the Pilgrims first landed on these shores, this nation's natural underground tank held an estimated 47 bil acre-ft of ground water. As of 1955, we had used up only 0.2 percent of this immense quantity. At the present rate of depletion the quantity of ground water known to be present in our aquifers would last for another 7,800 years. To make an estimation of the availability of groundwater for a particular region is a difficult matter, because this resource is completely hidden from view. The only way to determine how much groundwater can be pumped in a given region is to undertake careful studies of the geology, the natural rate of replenishment from rainfall, the ability of the formations to transmit water to wells, and similar factors. Often, such investigations call for test drilling and the carrying out of geo-physical surveys. Probing the earth in this way can be expensive, but there are no shortcuts, and as groundwater is one of our vitally important resources, the results are almost always well worth the investment. POLICIES FOR WATER LAW: PROPERTY RIGHTS, ECONOMIC FORCES, AND PUBLIC REGULATION,
Wyoming Univ., Laramie.
Frank J. Trealease.
Natural Resources Journal, Vol 5, No 1, May 1965. p 1-48, 141 ref.

Descriptors: *Legislation, Optimization, Economics, *Public rights, Cost-benefit analysis, Water utilization, Intangible benefits, Intangible costs, *Water rights, Regulation, Appropriation.
Identifiers: *Legislative policies, Property rights.

The paper analyzes the policies that lie behind water laws. Section I discusses the ultimate goal for water resource law - maximization of benefits. The suggested means for achieving this goal are property rights, economic forces, and public regulation. Section II describes a system in which property rights could maximize benefits, and discusses the acquisition of rights, the difference between public and private cost-benefit analyses, intangible costs - and benefits, duration of the water right, and the need for clear description of the right. Section III discusses economic forces. It considers changes over time in uses of water and changes from private to public use. Section IV, on public regulation, prevention of cost - shifting, and devices for protecting public interests. Present water law has many shortcomings. Many aspects of western water law prohibit optimal use of water. Maximum development is impeded by both western and eastern laws restricting the place of use. There are paper rights representing unused appropriations which may upset valuable existing uses. Some western laws tie water to land and prevent its movement on the market to higher uses. UNITED STATES GYPSUM CO V MYSTIC RIVER BRIDGE AUTH (ACCESS TO DOCKS BY WATER).

106 NE 2d 677-684 (Mass 1952).

Descriptors: *Docks, *Navigable waters, *Bridges, *Massachusetts, Eminent domain, Condemnation, State governments, Rivers, Riparian rights, Damages, Remedies, Judicial decisions, Bridges, Compensation, Bridge construction, Piers, Legal aspects.

Petitioner manufactured plaster board in a plant bordering a navigable river. Raw materials were transported by water to petitioner's plant. The respondant, Mystic River Bridge Authority, was created by statute to build a bridge for vehicular traffic. The authority was authorized to locate the bridge, acquire land and easements, and contract for erection of the bridge. In erecting the bridge, a pier was placed in the bed of the river approximately eighty feet offshore of the petitioner's wharves. This pier severely hampered petitioner's operations and decreased the value of his land. In a proceeding on the petition for assessment of damages, the jury awarded $262,950. On appeal, the court held that when an owner of a wharf on land bordering an arm of the sea has navigation between his property and the sea destroyed by the authorized construction of a bridge, neither the Constitution nor the common law required compensation. However, the legislature could choose to extend compensation to individuals who might suffer serious damage and who otherwise would receive no compensation. The legislature had authorized such compensation in the bill authorizing the bridge. (Gabrielson-Fla)

COMPREHENSIVE STATE PLANNING AS A FRAMEWORK FOR WATER RESOURCE DEVELOPMENT,
Arthur Ortiz.
In Thirteenth Annual Water Conference, Water for New Mexico to the Year 2000 and 2060, March 1968. p 48-58, 8 ref.

Descriptors: *New Mexico, *State jurisdiction, *Water resources development, Research and development, Area redevelopment, Long-term planning, Short-term planning.
Identifiers: *Planning districts, Rural-urban conflicts, Comprehensive planning.

The major function of the State Planning Office of New Mexico has been the development of a Statewide Resources Development Plan. Its first phase consisted of an inventory of the various resources of the state, with the resultant publication of approximately 40 studies. Resource availabi lity, development and related problems were analyzed, includi ng state water resources, water law and agricultural land and water. The second phase and current one consists of three aspects: (1) developing new techniques for handling emerging problems; (2) formulation of a Statement of Goals

and objectives to guide the state's overall comprehensive development; (3) provide direction to the programs of state agencies in terms of goals and objectives. The State Planning Office programs can be viewed most usefully as part of a planning process. The state has been divided into districts for planning and development purposes. Cultural patterns and major economic activities vary widely throughout the state and present opportunities and problems which are unique to particular regions. Each district may establish a regional planning commission, as permitted by New Mexico statutes. In terms of water resources development in the near future, the direction taken by the state's economy will be a critical factor. Improvements in the performance of state government should also promote effective water development policies. Finally, the creation of these planning and development districts also should yield benefits with respect to water development policies. As problems are resolved cooperatively on an area-wide basis, it is anticipated that conflicts between rural and urban interests over water utilization will lessen. (Starr-Chicago)

DITCHES AND DRAINS.

Minn Stat Ann secs 106.491 to 106.581 (1964).

Descriptors: *Minnesota, *Drains, *Ditches, *Drainage systems, Drainage engineering, Local governments, Drainage programs, Flood control, Sewers, Culverts, Bridges, Conduits, Outlets, Laterals, Pipes, Sewage disposal, Tiles, Obstruction to flow, Administrative agencies, Interstate, Legislation, Legal aspects, Cities.

If any ditch is obstructed by a bridge or culvert with an insufficient waterway opening to allow proper flow, the party responsible for such obstruction shall be required to remove it. Any improvement to a drain by tiling, enlarging or extending shall be preceded by a petition from affected property owners and a ruling by the county board or court based on a report of an engineer that the improvement is necessary. Improvements herein include only extentions downstream to a more adequate outlet or enlarging the original ditch system. Where a drainage system is likely to cause overflow of an existing drain, affected property owners may petition for improvement of the drain to eliminate the overflow. Persons owning land near an existing drainage system may petition for a lateral connecting the lands to the system. No private ditch may empty into a ditch authorized herein without permission of the county. The county or court ordering improvement of a drain may join with any adjoining state in the improvement if necessary. Any city desiring to use a public drainage system for a sewer outlet may petition the county controlling the drain. The petition shell have the approval of the state water pollution control commission. (Helwig-Fla)

MAINOR V HOBBIE (SUIT TO ENJOIN INTERFERENCE WITH FREE ACCESS RIGHTS TO BAY).
218 So 2d 203-206 (1st DCA Fla 1969).

Descriptors: *Florida, *Access routes, *Public rights, *Right-of-way, Recreation, Parks, Recreation facilities, Swimming, Bays, Legal aspects, Judicial decisions, Civil law, Real Property, Public rights.
Identifiers: Injunction.

This action was brought by subdivision property owners to enjoin other subdivision property owners from fencing in a portion of a street used for access to the bay and an irregular strip of land used as a recreation area. Plaintiffs based their access rights on a 1912 plat offering the contested area to the public for recreation and travel. Defendants claim that these access rights were cut off by a later suit to quiet title instituted by defendants' predecessors in title in 1951. The court, in finding for the plaintiffs, reasoned that a common-law dedication by the owner once accepted by the public was irrevocable by the owner or his successors in title except with the consent of the public and of those persons who had a vested right in the dedication. Looking at the 1951 suit to quiet title, the court ruled that since none of the plaintiffs herein were named or any public body having authority over streets were named, the quiet title suit did not cancel the alleged rights of the plaintiffs. SUSQUEHANNA RIVER BASIN COMPACT; ORGANIZATION, POWERS AND DUTIES OF THE COMM'N.

Md Ann Code, art 96A:61, 62 (Supp 1968).

Descriptors: *Maryland, *Interstate compacts, *Interstate commissions, *River basins, Legislation, New York, Pennsylvania, Governments, State governments, Water policy, Water resources, Water resources development, Interstate rivers, River basin commissions, Water law, Rivers, Conservation, Water management, Basins, Diversion, Planning, Jurisdiction, Administrative agencies.
Identifiers: *Susquehanna River Basin Compact, Water allocation.

The Susquehanna River Basin Commission is created as an agency of the governments of the signatory parties to the compact. The commission's jurisdiction shall be within the limits of the basin. The general powers of the commission shall be to develop plans and projects relating to water resources and to promote policies for water resources conservation and management. It shall be the policy of the commission to use existing offices of government to effectuate the compact. The specific powers and duties of the commission relating to water resources conservation, development and management are set out. The commission and the signatory parties shall promote cooperation among the parties to the compact in effectuating its policies and purposes. The commission shall have the power to allocate water to and among the parties and to enter allocation agreements with other commissions or states. The commission shall have the power of review and approval of all non-exempt water projects within the basin. The commission shall approve any project not detrimental to the proper conservation, development or management of the basin's water resources. Any procedure for review and approval of water diversions shall be at public hearing, subject to judicial review. (Helwig-Fla)

Identifiers: *Negligence.

Plaintiff brought this suit to compel defen
remove an inadequate culvert or bridge wh
part of a drainage project and to replace it
adequate culvert or bridge. Plaintiff owne
located within a certain area of a judicial dit
amount of $700 was awarded to defendant
struct a bridge over said ditch to accomm
county road. Twice defendant negligentl
structed the culvert which resulted in the a
lation of mud and dirt which rendered the d
effective. Plaintiff and other landowners in t
were subsequently assessed for costs resultin
the cleaning of the ditch. Plaintiff then so
compel defendant to remove and replace
adequate culvert with an adequate one and
the costs of cleaning the drainage ditch. Th
denied the relief sought. The court based i
sion on the fact that the county is an arm
state and thus immune from negligence sui
court indicated that plaintiff might have be
cessful had he pursued relief on the theory t
fendant was benefited by the ditch an
sequently subjected to the damages and b
provisions in the drainage law which dete
the method for assessment. (Holt-Fla)

ment, United States, Hydroelectric power.

In connection with water power and flood
development the United States, under th
merce clause, moved to condemn lands ow
defendant power company. The United Sta
pealed the District Court's ruling denying
tions to strike portions of answers asserting t
condemned land's potential as a hydro-
powersite constituted a permissible element
compensation. The court of appeals affirm
held that in arriving at just compensati
private property all elements entering in
value of the property must be taken into cor
tion. The land in question was bought by the
dant as a water power site and the United
condemned it for the same purpose. The
and most profitable use for which land is ad
and likely to be needed in the near future
considered. The absolute ownership and i
private property is not varied by the fact t
land borders on a navigable stream. An
taken which lie outside the bed of the strea
be compensated for, even when the govern
purpose is the improvement of navigation, u
commerce power. While it was true that
jacent owner does not own the water pow
of a river, it is also true that the governme
not have any servitude over such adjacen

s, Administrative agencies.
rs: Sanitary Water Board.

monwealth of Pennsylvania instituted this
gainst the defendants for illegally discharg-
strial wastes, injurious to animal and aquatic life, into Bear Creek and the Allegheny River. The defendant's plant discharged chemical wastes into a lagoon and then cut the bank or dike of the lagoon and drained the waters into the creek and river. By statute, any discharge that is injurious to aquatic life shall be unlawful and a nuisance. The defendant contended that the action would not be considered unlawful unless the Sanitary Water Board determined it as such. The court determined that the defense was affirmative and could only be relied upon if the Board had determined the discharges necessary because of the war. The defendant had made no effort to get a determination by the Board and could thus not rely on this defense. (Shevin-Fla)

NATIONAL BY-PRODUCTS, INC V UNITED STATES (GOVERNMENTAL TAKING BY FLOWAGE EASEMENT).

405 F 2d 1256-1275 (Ct Cl 1969).

Descriptors: *Eminent domain, *Easements, *Floods, *Flood protection, Levees, Floodprofing, Compensation, Federal government, Historic flood, Maximum probable flood, Flooding, Contracts, Banks, Damages, Streams, Streamflow, Riparian rights, United States, Judicial decisions, Legal aspects.
Identifiers: *Flowage easement.

Plaintiff owned property on the south bank of a stream. Defendant, United States, built a levee on the north bank to prevent the flooding of a military installation. Plaintiff alleged that a contract with defendant had been made to build a corresponding levee on the south bank. Plaintiff further alleged that because the government had not built the levee on the south bank, a flowage easement had been taken when plaintiff's land was flooded. He sought compensation for the alleged easement. The court held that the parties had entered into no contract for construction of a levee. It further held that even though the government can appropriate land by flooding, not all flooding is a taking. Plaintiff had to show that the flooding was induced or would inevitably recur and was not merely occasional flooding. The government is not liable for consequential damages arising from its lawful activities. Here defendant did not knowingly induce floods thereby taking flowage easements which would entitle plaintiff to compensation nor could plaintiff show permanent damage from recurring floods. (Helwig-Fla)
W69-08779

TRANSCONTINENTAL GAS PIPE LINE CORP V MR CHARLIE (DAMAGE TO SUBMERGED GAS PIPELINE).

294 F Supp 1025-1034 (E D La 1968).

Descriptors: *Pipelines, *Oil industry, *Drilling, *Law of the sea, Fuels, Natural gas, Oilfields, Oil, Oil wells, Locating, Subsurface mapping, Surveys, Right-of-way, Wells, Judicial decisions, Mines, Navigable waters, Legal aspects, Damages.
Identifiers: *Barges, Major-Minor Fault Doctrine.

Plaintiff owned a gas pipeline laid across the floor of the Gulf of Mexico. The permits and rights-of-way for the pipeline had been properly secured and the location charted. The line ran across a petroleum drilling field. Defendants, an oil company and its drilling contractor, secured an oil and gas lease from the United States. The oil company located the position for a well and began drilling operations. The drilling was accomplished by means of a submersible drilling barge which rested on the ocean bottom. The barge's stabilizing skirts made contact with and damaged plaintiff's pipeline. The court held that the oil company was negligent to a major degree by selecting and locating the proposed well spot and not checking for existing pipelines in the area. The court allowed plaintiff to recover for the damages it its pipeline. (Helwig-Fla)

PETROLEUM PIPE LINES ACROSS FRESH WATER STREAMS.

NJ Stat Ann secs 58:10-24 to 58:10-35.4 (1966).

Descriptors: *New Jersey, *Pipelines, *Fresh water, *Underground storage, Administrative agencies, Administrative decisions, Pipe flow, Permits, Oil, Gases, Streams, Leakage, Remedies, Damages, Regulation, Legal aspects.
Identifiers: Judicial review, Penalties (Civil), Penalties (Criminal).

Extensive regulations govern the construction, operation, maintenance and removal of petroleum pipe lines across fresh water streams in New Jersey so as to prevent pollution via the escape of pipe line contents. Administration of these regulations is by the commissioners of water supply. Detailed notice of alleged violations of these regulations must be given by the commission and hearings held thereon. If the decision of the commission is against the pipe line user or owner, written specifications relative to remedying the defect are required to be submitted to the commission which can approve or disapprove them, substituting therefore its own specifications. Review of the commission's decisions can be had in the superior court. Violators of these regulations are subject to civil and criminal penalties. Regulations also govern the underground storage of petroleum products having as their purpose the prevention of pollution and protection of the public health, safety and welfare. Administration of these regulations is by the commissioner of the Department of Conservation and Economic Development. (Carruthers-Fla)
W69-08781

PETROLEUM PIPE LINES ACROSS FRESH WATER STREAMS.

NJ Stat Ann secs 58:10-24 to 58:10-35 (1966).

Descriptors: *New Jersey, *Pipelines, *Fresh water, *Underground storage, Administrative agencies, Administrative decisions, Pipe flow, Permits, Oil, Gases, Streams, Leakage, Remedies, Damages, Regulation, Legal aspects.
Identifiers: Judicial review, Penalties (Civil), Penalties (Criminal).

After defining 'commission', 'fresh water', and 'pipeline', the statutes prohibit construction, reconstruction, or removal of pipelines across fresh water streams except in a manner approved by the commission and in accord with the statutory provisions. If the commission feels that any pipeline's contents may leak into any fresh water it can hold a hearing with the pipeline owners, and shall give proper notice of the hearing and of its decision regarding danger of escape of pipeline contents. Within 15 days of this decision the owners are to submit specifications for reconstruction of such pipeline which specifications can be approved or substituted for by the commission. Reconstruction shall begin within 30 days of the notice of decision, or else the dangerous portion of the pipeline shall be removed at the owner's expense. For purposes of such removal the commission may freely enter upon lands. Any proceeding of the commission may be reviewed by the Superior Court. Where a ruptured or leaking pipeline causes injury to any fresh water, the commission may apply to the courts for immediate relief. A $500 a day fine is the penalty for pipeline construction in a non-approved manner, with a remedy in damages available to the commission for leakage even if pipelines are constructed in an approved manner. (Carruthers-Fla)
W69-08782

UNDERGROUND STORAGE OF GAS, PETROLEUM PRODUCTS.

NJ Stat Ann secs 58:10-35.1 to 58:10-35.4 (1966).

Descriptors: *New Jersey, *Pipelines, *Fresh water, *Underground storage, Administrative agencies, Administrative decisions, Pipe flow, Permits, Oil, Gases, Streams, Leakage, Remedies, Damages, Regulation, Legal aspects.
Identifiers: Judicial review, Penalties (Civil), Penalties (Criminal).

A permit is required from the Commissioner of the Department of Conservation and Economic Development for natural underground storage of gas and other petroleum products. This act is not applicable to installation of artificial underground storage tanks. The commissioner is empowered to prescribe rules and regulations to effectuate provisions of this act and may impose restrictions on any permit if he considers the same necessary in the public interest to protect the waters of the state Anyone violating the provisions of the act shall be guilty of a misdemeanor. Every application for a permit shall be accompanied by at least two copies of an accurate map prepared by a competent engineer or geologist showing the location, extent and depth of the proposed storage place and of all wells drilled or proposed to be drilled to such storage place. The commissioner shall determine whether the granting of any such application would be likely to endanger the public safety, health, and welfare and may use in such determination the written report of the Water Policy and Supply Council. (Carruthers-Fla)

IN RE SCHURZ (TITLE TO STREAM BEDS).

278 App Div 309, 104 NYS 2d 395-397 (1951).

Descriptors: *New York, *Stream beds, *Navigable waters, *Ownership of beds, Streams, Streamflow, Channel flow, Floods, Water levels, Tides, Mud flats, Slat marshes, Tidal effects, Damages, Judicial decisions, Legal aspects, Road construction, Relative rights, Beds under water, State governments.

The city of New York sought to acquire title to real property required for street construction. The contest involved rights to certain navigable waters. The claimants asserted title to certain lands which at times were under water. They maintained that the state, if wishing to acquire such lands for street construction, would be required to pay damages. The state contended that the title to the beds was reserved for the sovereign and therefore no damages should accrue. The court held that the grant of land to an individual by a sovereign which included a stream of water subject to the ebb and flow of the tide did not carry with it title to the stream bed. The land in question, the court said, consisted of salt meadows and sledge flats which were under water only at extreme floods and then only to the extent of a few inches. The court held that these flats could not be said to be reserved by the sovereign as part of the stream. The court held that the title to the land involved was in the claimants. The case was remanded so that damages could be awarded. (Shevin-Fla)

Identifiers: *Watershed districts.

The Water Resources Board may establish watershed districts for the purpose of conservation and flood control. The districts shall be established upon petition of local governments or freeholders if the public welfare will be served by such action. Each such district shall be governed by district managers appointed by the Board. The managers shall have the power to do necessary acts to effectuate the purposes of this chapter and of the district. The managers shall plan projects, accept petitions from freeholders for projects, conduct hearings on these projects and carry out the construction of such projects as are deemed beneficial. Costs of the projects may be assessed against land benefited thereby. The managers of a district shall acquire, construct, operate and maintain drainage systems within the district and insure a proper drainage program. The managers may enter contracts of cooperation with other governmental entities for the benefit of the district. Rights of landowners shall not be impaired by projects of the district. No one shall be denied due process in any proceeding by the district. (Helwig-Fla)
W69-08785

ESTABLISHMENT OF WATERSHED DISTRICTS.

Minn Stat Ann, secs 112.34 to 112.411 (1964).

Descriptors: *Minnesota, *Watersheds (Basins), *Watershed management, *Water conservation, Erosion control, Flood control, Legislation, Administrative agencies, Land tenure, Local governments, Land management, Navigable streams, Surface runoff, Drainage, Recreation, Water supply, Hydrology, Beds, Banks, Riparian land, Public health, Public benefits, Land reclamation, Irrigation.
Identifiers: *Watershed districts.

The Minnesota Water Resources Board is empowered to carry out natural resources conservation and flood control by establishing watershed districts. Watershed districts shall be for the purposes of flood control, stream regulation and improvement, land reclamation, irrigation, providing for domestic, industrial and recreational water supply, promoting public health, improving drainage, controlling soil erosion and preserving stream beds and riparian lands. The local governments or the freeholders within a proposed district may petition the Board for establishment of a district. The Board shall hold a public hearing on the petition. If it appears a district would serve the public welfare, the Board shall establish such as a potitical subdivision, name managers thereof and establish a principal place of business. A district shall have perpetual existence and the power to do all authorized acts. A district may be terminated upon a determination, after a petition and hearing, that it no longer serves the public welfare or is no longer needed. (Helwig-Fla)

Identifiers: *Sewerage systems.

The terms 'waters of the State', 'sewage', 'waterworks', and 'sewerage systems' are defined. The State Board of Health shall have general control over the waters of the State insofar as their condition affects public health and it may make regulations to correct and prevent pollution. All waterworks and sewerage systems shall be examined and their operation in a manner which will protect public health compelled. The Board may upon request consult with municipalities or private persons as to the most appropriate sources of water supply and the best methods of sewage disposal. It shall also advise industries whose manufacturing may tend to pollute state waters. When the Board finds any waters in danger of pollution because of defective water supply or sewerage systems, it may order the installation of a public system or the completion of the existing system. When waters are polluted by industry, the Board may order cessation of pollution or order alterations in disposal methods. Alteration plans must be submitted by the industry for approval and a permit issued for use of the revised method. The Board shall supervise the bottling of water for potable purposes, and no such water shall be bottled except under permit of the Board. (Kahle-Fla)

Descriptors: *Vermont, *Flood control, *Federal-state water rights conflicts, Legislation, Administrative agencies, Dams, Reservoirs, Flood damage, Multiple-purpose projects, Federal government, Political aspects, Cities, Damages, Water resources development, Connecticut, Massachusetts, Water rights, Public lands, Rivers, Taxes, Reimbursable costs, Local governments, Interstate compacts, Interstate rivers.
Identifiers: *Connecticut River Valley, Connecticut River, Economic loss.

The Connecticut River Valley Flood Control Commission shall consists of three members to be appointed by the governor for staggered terms of six years. Vacancies on the Commission shall be filled as provided for by general state law except that the governor may make interim appointments to fill vacancies that come into existence while the state senate is in adjournment. Provisions are made for expenses of the commissioners and appropriations for the Commission. When reimbursement for losses stemming from federal ownership of flood control dams or reservoirs are received from Massachusetts or Connecticut, the state treasurer must notify the state auditor. The board must keep accurate records of all reports issued by the auditor in this regard. The state shall reimburse its political subdivisions for ten per cent of the amount lost to them by reason of the federal ownership of such flood control dams and reservoirs and not reimbursed by Massachusetts or Connecticut. DAMS AND DRAINS; GENERAL PROVISIONS.

SC Code Ann secs 18-401 thru 18-411 (1962).

Descriptors: *South Carolina, *Drainage districts, *Water conservation, *Water utilization, Legislation, Levees, Land tenure, Land, Canals, Drains, Ditches, Watercourses (Legal), Damages, Conservation, Costs, Construction, Flood protection, Flood control, Floodwater, Water storage, Erosion control, Waste water disposal, Administrative agencies, Legal aspects, Water storage, Financing.
Identifiers: Obstruction to drainage, Penalties (Criminal), Penalties (Civil).

If any drainage district organized under this chapter is in an area where another district is already established, the newer district shall be known as a subdrainage district. Whoever shall obstruct or damage any drainage works constructed under this chapter shall be guilty of a misdemeanor, subject to fine or imprisonment and be liable for double the cost of removing such obstruction or repairing such damage. Drainage districts may be used as agencies of the state for insuring watershed conservation. The board of supervisors of the district may authorize the development and execution of programs relating to any phase of water conservation, water usage, flood prevention, flood control, control of erosion, floodwater and sediment damages, and may make provisions for constructing such works as they believe necessary to insure conservation and storage of water within the district. Drainage districts may enter into agreements with and receive financial assistance from state agencies, federal agencies, or private landowners. (Shevin-Fla)

LAKE LEVELS INVESTIGATION AND PROCEEDINGS.

NH Rev Stat Ann secs 484:1 thru 485:1 (1968).

Descriptors: *New Hampshire, *Water levels, *Investigations, *Outlets, Legislation, Withdrawal, Administrative decisions, Administrative agencies, Riparian rights, Public benefits, Management, Public rights, Water level fluctuations, Inland waterways, Outlet works, Regulation.

The water resources board may make preliminary investigations of conditions affecting the use of any inland public water of the state. If such investigation indicates that the management and control of any outlet of such public water seriously or adversely affects shore property above or riparian rights below such outlet or the enjoyment of such water by the public, the board may make further investigations and ascertain the respective rights of all interested parties. Even though such management is deemed lawful the board may recommend changes therein that would benefit other interested parties and not injure the owner of the outlet. If the recommended changes would injure the owner or other interested parties the board may estimate damages occasioned thereby and report its findings to the governor. If the owner's actions are unlawful the attorney-general may institute proceedings against him. Unlawful use of an outlet subjects one to a maximum fine of $1000. Withdrawals from Lake Winnipesaukee are statutorily controlled; however, in emergency situations the board has the power to vary the defined withdrawals. (Holt-Fla)
W69-08795

DESIGNATION OF NAVIGABLE STREAMS AND PENALTIES FOR OBSTRUCTION THEREOF.
SC Code Ann secs 70-1 - 70-7 (1962), as amended, (Supp 1968).

Descriptors: *South Carolina, *Navigable rivers, *Obstruction to flow, *Rivers, Bodies of water, Legislation, Streams, Navigable waters, Navigation, Riparian rights, Streambeds, Water pollution, Barriers, Local governments, Public health, Legal aspects, Timber piles, Lumber, Lumbering.
Identifiers: *Obstruction of navigation, Penalties (Criminal).

All streams rendered capable of being navigated by rafts of timber or lumber and all navigable watercourses are declared navigable streams. They shall be common highways and forever free to all inhabitants of this state and all citizens of the United

States. Anyone obstructing such a stream shall be guilty of a nuisance. Anyone cutting trees or logs or throwing refuse into any navigable stream or anyone floating logs so as to obstruct any river shall be guilty of a misdemeanor. All timber or rafts floating so as to be dangerous to navigation shall be captured and sold at market. All riparian landowners shall keep clean all streams adjacent to their land. Certain enumerated counties shall be exempt from provisions of section 70-3 and 70-4 of this title pertaining to obstruction of navigable streams. The cutting or felling of trees into streams in certain enumerated counties so as to lessen the flow or endanger the community health shall be a misdemeanor. (Helwig-Fla)

WATER POLLUTION (POWERS OF COMMISSION IN RELATION TO POLLUTION).

Del Code Ann tit 7, secs 6301-6306 (Supp 1966).

Descriptors: *Delaware, *Pollution abatement, *Water pollution control, *Administrative agencies, State governments, Public health, Industrial wastes, Sewage, Regulation, On-site investigations, Legal aspects, Administration, Research and development, Recreation, Public rights, Investigations, Legislation, Administrative decisions.
Identifiers: *Summary proceedings, *Injuctions (Prohibitory), Public hearings, Water and Air Resources Commission.

It is part of the public policy of this state to prevent new pollution of the state's water and to control existing pollution. The Water and Air Resources Commission has jurisdiction to regulate water pollution by enforcing the laws relating to water pollution. The commission shall study and investigate all problems of pollution and recommend solutions. Also the commission shall adopt regulations for the installation of systems to control pollution. The commission may issue orders directing private persons or other political entities to control pollution. To insure compliance with its orders the commission may make investigations and inspections. The commission may at reasonable times inspect any industrial or municipal establishment for conditions relating to pollution. Also the commission may require information from any person pertinent to the commission's duties. When the commission's orders are not complied with, the commission may seek an injunction to prevent further violations. The commission may institute immediate action to protect public health by issuing a written directive ordering the cessation of pollutant discharges. As soon as possible thereafter, a hearing must be given to persons directed to so cease. (Gadd-Fla)

TAX DITCHES.

Del Code Ann tit 7, secs 4185-4193 (1953), as amended, (Supp 1966).

Descriptors: *Delaware, *Administrative agencies, *Drainage districts, *Land management, Drainage, Legislation, Regulation, Jurisdiction, Ditches, Taxes, Government finance, Water law, Legal aspects, Land, Permits, Maintenance, Drainage programs, Maintenance costs, Financing, Operation and maintenance.
Identifiers: *Tax ditches.

Ditch managers are responsible for removal of obstructions and repair of ditches caused by persons either willfully or negligently when, after a warning, such persons refuse to correct a situation caused by them which damages a drainage system. Such person is liable for all loss or injury caused by his actions. Upon petition to and approval by the superior court a ditch order may be amended so as to allow a landowner to be included in a tax ditch formed under provisions of this chapter. When land drains into a tax ditch when said land's owner is not a member of same, such landowner is responsible for the cost necessary to adding his lands to the ditch order and is subsequently liable for taxes on same. A tax ditch may be changed as deemed necessary by majority vote of the taxables present at regularly called tax ditch meetings. A tax ditch may be dissolved in a similar manner. Bridges and culverts under public roads as well as ditches near highways are maintained at the expense of the state. (Johnson-Fla)

GASSAWAY V TRAVELERS INS CO (DAMAGE FROM UNDISCLOSED STORM SEWER).

439 SW 2d 605-610 (Tenn 1969).

Descriptors: *Tennessee, *Storm drains, *Drainage, *Subsurface runoff, Drains, Conduits, Drainage systems, Intakes, Pipes, Land tenure, Surface runoff, Judicial decisions, Legal aspects, Damages, Insurance, Risks, Construction, Foundations, Accidents, Remedies.
Identifiers: Open-throat inlet, Negligence.

Plaintiffs owned a residence beneath which defendant's insured had constructed an underground storm sewer. Plaintiffs and their grantors had no knowledge of the drainage facilities. Defendant had contracted to insure the builder of the residence against liability for accidental injury to the property. Water discharging from the drainage facilities caused the foundation of plaintiffs' house to settle. Plaintiffs obtained a judgment against the builder and sought in the court of chancery to collect on the judgment from defendant insurer. From a finding for plaintiffs, defendant appealed. The supreme court reversed, holding that in order for plaintiffs to collect the damage must result from an accident. The builder sold the lot with the knowledge of the existing drainage facilities along with the risks involved and had reason to believe that subsequent purchasers would not discover such conditions. The damages resulted from the negligence of the builder in not disclosing the adverse condition and potential damages which he could have reasonably foreseen. The damages did not result from an accident but from the builders negligence, and were not covered by the terms of the policy. (Helwig-Fla)

LAKE CHARLES HARBOR AND TERMINAL DIST V HENNING (EMINENT DOMAIN PROCEEDINGS IN PORT IMPROVEMENT).

409 F 2d 932-937 (5th Cir 1969).

Descriptors: *Louisiana, *Eminent domain, *Administrative agencies, *Harbors, Land tenure, Planning, Compensation, Judicial decisions, Legal aspects, Condemnation, Condemnation value, Local governments, Land appraisal, Port authorities, Storage tanks, Public benefits, Public rights, Jurisdiction, Adjudication procedure.
Identifiers: Harbor districts.

A harbor district brought expropriation proceedings for land as bulk storage facilities in a plan to improve the port. The nonresident landowners removed to the federal district court. The court held the land was expropriated for a public purpose and the court of appeals affirmed. The district's action did not violate the due process requirements of the fourteenth amendment since the district planned to construct bulk handling facilities of port commodities as an integral part of a port improvement plan. Although there was only one prospective user, the use was still public since any potential user had the same opportunity for use. There need not be actual immediate necessity for expropriation as long as there was a demonstrated future need and intended construction of the facilities within a reasonable time. The court refused to interfere with the district's discretion concerning the extent of property taken. The court also upheld the method of valuation by averaging four expert appraisals and the awarding of expert witness fees to the landowners as costs or as part of just compensation. (Breeze-Fla)

STATE HIGHWAY COMM'N V RISS (CONDEMNATION VALUE OF LAKE PROPERTY).

432 SW 2d 193-200 (Mo 1968).

Descriptors: *Missouri, *Condemnation, *Condemnation value, *Property values, Eminent domain, Right-of-way, Highways, Road construction, Lakes, Land development, Land use, Administrative agencies, Administrative decisions, Judicial decisions, Legal aspects, Water law, Landfills, Water rights, Flooding, Damages.

Defendant landowner was awarded $66,000 for part of a 680 acre tract condemned and taken by the state for highway purposes. Exceptions were taken regarding the condemnation value of the property taken and a jury awarded defendant $125,000. Defendant appealed from this latter award contending that the presence of a man-made lake, one end of which the proposed highway was to cross, enhanced the value of the property for development purposes to $1,342,500. Defendant's witness testified that this value figure was reached by a capitalized method of valuation and also that presence of the highway would destroy the value of the property for development purposes. The court agreed that the best use of defendant's property may have been prevented by the condemnation but that unless defendant was in such a position to have carried out such development at the data of the taking, value for development purposes could not enter into the damage computation. The court held, therefore, that the fact that the lake enhanced the value of the porperty for development purposes did not justify use of a capitalized method of valuation and affirmed the jury award of $125,000. (Carruthers-Fla)

KENTON COUNTY WATER DIST V ROGERS (JURY DAMAGES AWARD IN CONDEMNATION PROCEEDINGS).
433 SW 2d 891-893 (Ky 1968).

Descriptors: *Kentucky, *Condemnation value, *Easements, *Water storage, Storage tanks, Condemnation, Right-of-way, Conduits, Judicial decisions, Land tenure, Eminent domain.
Identifiers: *Highest and best use, Subdivision property, Enhancement value.

In a condemnation proceeding, condemnor obtained 1.72 acres of land on a 30 acre farm for the construction of a water-storage tank. Condemnor also obtained easements for a roadway and a sixteen inch water main. The jury awarded condemnees $9,000 after expert witnesses established the highest and best use of the land as subdivision property. On appeal by condemnor, the Court of Appeals of Kentucky held that although some of condemnee's witnesses lacked knowledge of subdivision property values, and others failed to allow enhancement value from the new roadway, the jury did not award excessive damages to condemnees. The court of appeals affirmed the jury award. (Harris-Fla)

ATLANTIC MARINE FISHERIES.
NH Rev Stat Ann secs 213:1-213:6 (1964), as amended, (Supp 1967).

Descriptors: *New Hampshire, *Interstate compacts, *Marine fisheries, *Atlantic Ocean, Shellfish, Anadromous fish, Marine fish, Commercial fishing, Sport fishing, Regulation, Legislation, Administrative agencies, Fish conservation, Fisheries, Fishing, Fish management, Interstate commissions.

The provisions of the Atlantic States Marine Fisheries Compact are set out. The purpose of the compact is to promote better use of Atlantic seaboard fisheries through development of a joint program. The compact shall become effective whenever two of the listed Atlantic states have executed it. Each signatory state is to appoint three representatives to an interstate commission which shall ascertain methods to conserve marine, shell anadromous fisheries. The commission shall draft and recommend legislation to the various states, advise administrative agencies as to problems of fisheries and recommend stocking programs. The federal fish and wildlife service of the department of the interior shall act as a research agency for the commission. An advisory committee of commercial fishermen and salt-water anglers shall be set up to advise the commission. Each member state agrees to contribute to the support of the commission in proportion to the value of its fisheries' products. Each state initially agrees to contribute an amount based upon the catch record of 1938. Subsequent budgets will be recommended by a majority of the commission. An amendment to the compact allows joint regulatory agencies among consenting states with respect to common fisheries. The governor of New Hampshire is authorized to execute the compact on behalf of New Hampshire. The New Hampshire commission members are the fish and game director, a legislator who is a member of the commission on interstate cooperation, and a private citizen appointed by the governor. BRIDGES.
Vt Stat Ann tit 19, secs 1601-1604, 1621-1625, 1711-1718 (1968).

Descriptors: *Vermont, *Bridges, *Operation and maintenance, *Management, Administrative agencies, Costs, Cost transfer, Cost repayment, Bridge construction, Bridge design, Maintenance, Maintenance costs, Operating costs, Legislation, Legal aspects, Administration, Local governments, Cities, Eminent domain, Roads, Highways, Appropriation, Financing, Culverts, Transportation, State governments, Political aspects.
Identifiers: *Covered bridges, *Toll bridges, Penalties (Civil), Drawbridges.

Operation, maintenance and all powers incidental thereto vested in the Missisquoi Bay Bridge Commission are transferred to the state highway board. The board shall: (1) operate and maintain the Missisquoi Bay bridge; (2) assume outstanding liabilities created by the Commission; (3) pay outstanding notes of said Commission; and (4) accept and receipt for cash turned over to the board by said Commission. The board shall maintain, toll free, the sandbar bridge and the highway extending southerly therefrom. The selectmen shall cause covered bridges, located where a highway approaches such bridge from an angle, to contain openings on the side facing the highway. The use of covered bridges may be restricted to vehicles in regard to weight, height, and width. Voting procedures respecting the establishment of such restrictions and penalties for violations of such restrictions are provided. Public notice shall be given of the intent to destroy or remove a covered bridge. Drawbridges conveyed to the state shall be operated and maintained by the state. State highway board members shall also be toll bridge commissioners, and shall have the power of eminent domain, the authority to make agreements regarding the freeing of toll bridges, the authority to reimburse towns for their freeing of toll bridges and shall have general supervision over such freed toll bridges as are in Vermont. Any person crossing toll bridges without paying the toll shall be fined. (Carruthers-Fla)

DISPOSAL OF WASTEWATER FROM WATER FILTRATION PLANTS.

Am Watrwks Ass'n J Vol 61, No 7, p 322-326, July 1969. 5 p, 2 ref.

Descriptors: *Water purification, *Waste water disposal, *Waste water treatment, *Water pollution sources, Coagulation, Flocculation, Filtration, Sludge treatment, Freezing, Financial feasibility, Chemical reactions, Density, Beds, Sedimentation, Sediment discharge, Suspension, Turbidity, Chemical analysis, Water chemistry, Filtering systems, Quality control, Settling basins.
Identifiers: Water filtration plants, Precoat vacuum filter, Alum recovery

Recent changes in standards of many states have classified the waste flows from water filtration plants as potential pollutants. Although such waste flow consists only of the same solids that wo normally be found in the stream, they are poter pollutants because their increased concentra may inhibit biological activity in beds where t settle and because they would be readily disce bie and easily stirred up by turbulence in receiving water. Four possible methods for trea such pollutants are briefly discussed. There are: disposal to the sewerage system for treatment; filtration on a precoat vacuum filter; (3) freezin change the character of the gelatinous hydroxid granular form; and (4) alum recovery by regen tion with sulfuric acid. The advantages and di backs, including the financial feasibility of e method is discussed. The freezing process is gested as most advantageous where land are available for sludge volume produced and wh suitable winter temperatures occur. Alum recov is cited as most advantageous for large filtra plants where round-the-clock operation could maintained. (Kahle-Fla)

NATURAL RESOURCES DEVELOPMENT BOARD.

Ill Ann Stat ch 19, secs 1071 thru 1077. 13 (Smith-Hurd Supp 1969).

Descriptors: *Illinois, *Administrative agencies, *Water resources development, *Water conservation, Water resources, Water quality, Watersheds (Basins), Navigation, Rivers, Legislation, Regulation, Government finance, State governments, Federal government, Project planning, Water supply, Flood control, Project purposes.

The Natural Resources Development Board is created in order to insure proper planning for the conservation and development of water resources. The members of the board shall be the directors of certain related state agencies and shall serve without compensation. The Board shall prepare a biennial assessment of the quality and quantity of available water resources and recommend legislation to insure adequate future supplies. In addition the Board shall: disseminate information to citizens regarding water supply programs; advise the governor on proposed federal and state legislation; implement policies to insure coordination of state agencies; examine state projects, identify areas where new projects are needed, and report to the governor thereon; represent the state in federal projects involving more than one state agency in matters of navigation, flood control, rivers, and watersheds; administer local programs for water resources and development as provided by law; establish and supervise regional water resources management commissions; cooperate with public and private agencies and receive funds from such agencies or the federal government; and administer all programs authorized by the legislature pursuant to the Natural Resources Bond Act. DRAINAGE AND FLOOD CONTROL.

Ill Ann Stat ch 42, secs 472, 473, 481, 482 (Smith-Hurd Supp 1969).

Descriptors: *Illinois, *Flood control, *Administrative agencies, *Drainage, Legislation, Legal aspects, Water law, Water policy, Financing, Sewage disposal, Water utilization, Projects, Administration, Public health, Sewers, Drainage systems, Hydrographs, Drainage districts, Flood protection, Charts, Distribution patterns, Floods, Hydrograph analysis, Rainfall, Runoff, Mapping, Assessments.

The Department of Public Works and Buildings is responsible for making a survey and preparation of a master plan for drainage and flood control of all watershed areas of this state so that hazards to persons and property may be reduced. Such plan includes the full hydrography of each watershed area including rainfall, runoff, frequency and severity of floods. A drainage district may, when it finds that its drainage system is collecting sewage which is a menace to public health, construct a sewage disposal system to eliminate such sewage. Such a

system may be financed through assessments on the lands benefitted. Revenue bonds may be used to pay the initial costs of such construction, to be repaid solely from the revenue from the operation of such system. The Department is responsible for general coordination and supervision of the efforts of the individual districts. It may also enter agreements with the federal and local governments for the formulation of plans, including funding, and for the construction, operation and maintenance of improvements for flood control, drainage and utilization of water and water resources. (Johnson-Fla)

SANITARY DISTRICTS OUTSIDE OF MUNICIPALITIES.
Ill Ann Stat ch 42, secs 418, 421, 433, 437, 438, 439 (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Illinois, *Administrative agencies, *Environmental sanitation, *Sewage disposal, Water purification, Sanitary engineering, Water law, Legislation, Legal aspects, Water policy, Administration, Financing, Taxation, Dams, Public health, Sewage treatment, Planning, Sewers, Sewage, Water utilization, Water pollution, Water pollution control, Water quality control.
Identifiers: *Sanitary districts, Special assessments.

The board of trustees of any sanitary district is responsible for the collection and disposal of sewage within their area and must protect the water supplied to their inhabitants from contamination. They may use such conduits, pipes and pumps as are necessary to construct an adequate sewage system for this purpose. They must also treat and purify all sewage before allowing same to flow into any lake, river or other water course. While real and personal property may be taken for the district's corporate purposes, whether by purchase or condemnation, adequate compensation must be paid therefore either by gross sum or annual rental. The district's sewers may pass along or under public roads or public ground and may have conduits and pipes laid under public waters, but in either case not in such a manner as to impede normal use thereof. A district has the power to keep its water courses free from pollution and may construct dams and remove debris from same in the interests of public health. The board may finance costs of such a system either through general taxation or special assessment. (Johnson-Fla)

Identifiers: Special assessments, Sanitary districts.

A sanitary district may construct and maintain its sewers, channels, ditches and drains along, across or under any highway, street or public ground of the state so long as public use of such property is not hampered. Districts may construct and maintain such conduits and pipes upon any of the lands of the state which are under public waters provided permission from the governor is obtained before so doing. The board of trustees of each district is responsible for the construction of necessary facilities within the district including drains, sewers, laterals and pumping stations which are financed by either general taxation or by a combination of general taxation and special assessments. When a district has constructed a sewage disposal plant, the board of trustees may build a dam or dams to regulate the flow of the waters of any stream or river if the public health would be improved thereby. The board may also take such action as is necessary to remove debris, refuse and other objectionable matter from any river within the district after the construction of a sewage disposal plant. (Johnson-Fla)

e public announcement of a construction project
en precedes construction by several years. The
veloper who moves in early to be adjacent to the
provement will often acquire his property before
public agency has acquired the land required to
ild the proposed improvement. As a result, often
public agency must purchase or condemn part
the land that the developer bought. The problem
sing is that land values increase after the an-
uncement of the planned improvement. The
veloper paid a higher price because of the
posed improvement, but the public agency
en will offer him less than he paid for the proper-
Courts usually rule that the value of a property
not be enhanced legally by reason of its prox-
ty to the very project for which the property is
ng acquired. The rule also works in reverse so
t properties cannot be depressed in value by the
nouncement of an unpopular or unattractive
icture, such as a proposed sewer plant in an
ablished neighborhood. The value of the proper-
acquired must be measured at its value before
announcement of the proposed improvement.

AINAGE DISTRICTS (1-7).

Va Code Ann, sec 19-21-1 thru 19-21-41
66), as amended, (Supp 1968).

scriptors: *West Virginia, *Drainage districts,
risdiction, *Financing, Legislation, Water law,
al aspects, Taxes, Eminent domain, Assess-
nts, Administration, Construction, Cost-benefit
o, Appraisals, Publications, Reviews, Adminis-
trative agencies, Costs, Bridge construction, Planning, Ditches, Operation and maintenance.

Drainage districts are to be organized under circuit court jurisdiction. Objections and appeals to the formation of districts are provided for. The act makes provisions for: owners' meetings; the election of a board of supervisors and the appointment of a chief engineer; and the funding of preliminary expenses. A board of appraisers is to be established for assessing the benefits to those property owners within the district. A jury assessment is to be available. The procedure for letting contracts is enumerated. The act provides for the annual levying of taxes and the method of collection. It indicates when the taxes are payable and outlines the procedure for collection of delinquent taxes. All bonds are considered liens on the district lands. The power to drain, protect and reclaim land is given to the board. The district shall have the power to eminent domain. Costs of bridge construction are to be borne by the district. Actions are not abated by the death of the parties. Procedures for formulating new plans, removing officers, connecting, maintaining, and preserving ditches and consolidating adjacent districts are outlined. A penalty is prescribed for obstructing drains. (Holt-Fla)
W69-08878

DRAINAGE DISTRICTS (1).
W Va Code Ann, sec 19-21-1 thru 19-21-5 (1966), as amended, (Supp 1968).

Descriptors: *West Virginia, *Drainage districts, *Jurisdiction, *Land reclamation, Public benefits, Public health, Legislation, Water law, Engineers estimates, Engineering personnel, Reclamation, Wetlands, Construction, Administrative agencies, Legal aspects, Cities, Flood control.

The circuit courts are conferred with the power to establish, organize and provide for the operation and maintenance of drainage, levee and reclamation districts. When organized the districts have the power to reclaim lands and construct such levees, ditches and canals as are necessary to carry out the purposes of the act. These purposes are to improve wetlands and to protect cities from overflow. All district projects must result in public benefits, promote the public health or be conducive to the general welfare of the community. Three or more owners of real property within a proposed district may petition the court to establish a drainage district. The petition must generally describe the lands to be reclaimed and the advantages that will result from the proposed improvement. After the petition is filed the court shall appoint a qualified engineer who must recommend the general improvements required, make an estimate of their costs and file a list of all property holders within the proposed district. Following the engineer's report the circuit clerk must publish a notice to the property owners that the petition has been filed. Procedures are outlined by which any landowner within the proposed district may object to its formation. (Holt-Fla)

DRAINAGE DISTRICTS (2).
W Va Code Ann, sec 19-21-6 thru 19-21-11 (1966), as amended, (Supp 1968).

Descriptors: *West Virginia, *Drainage districts, *Drainage programs, *Administration, Administrative costs, Legislation, Organizations, Water law, Land reclamation, Reclamation, Taxes, Tax rate, Financing, Supervisory control (Power), Surveys, Engineers estimates, Drainage engineering, Project planning, Costs.

Within 30 days after any drainage district is established the circuit clerk shall call a first meeting of the landowners for the purpose of electing a board of supervisors. Subsequent to the first meeting the board shall call annual meetings of the landowners to re-elect supervisors. The board of supervisors is required to annually report to the landowners any work that has been done in the district. A competent civil and drainage engineer shall be appointed by the supervisors within 30 days after organization of the district. His duties shall be to survey all lands within the district that may be improved or reclaimed and to submit a proposed plan for draining, leveeing, and reclaiming the lands described in the survey. If the board approves the plan it shall be designated as 'the plan for reclamation.' A tax of up to 50 cents per acre on all lands within the district shall be levied by the board to defray preliminary expenses. (Holt-Fla)
W69-08880

DRAINAGE DISTRICTS (3).
W Va Code Ann, sec 19-21-12 thru 19-21-16 (1966), as amended, (Supp 1968).

Descriptors: *West Virginia, *Reclamation, *Assessments, *Appraisals, Legislation, Water law, Administration, Drainage districts, Judicial decisions, Railroads, Right-of-way, Maintenance costs, Benefits, Damages, Condemnation, Administrative decisions, Compensation, Property values.

Upon acceptance of a plan for reclamation by the board of supervisors and the filing of it with the circuit court, 3 uninterested appraisers are to be appointed by the judge whose duties shall include the assessment of benefits and damages that may result from implementation of the plan. The chief engineer shall accompany and advise the appraisers. When assessing benefits on each parcel of land within the district due credit is to be given for any existing systems of reclamation. Railroads and rights-of-way shall be assessed according to the increased physical efficiency and decreased maintenance costs. Lands outside the district's boundaries that will be benefitted are to be assessed and reported to the court for possible inclusion within the district. Notice by publication of the appraisers' report is to be given. Interested parties may file exception to the appraisers' report with the court and a summary hearing shall be provided. Anyone aggrieved by an assessment may present his complaint to the circuit court. The court's findings may be appealed. Property owners not accepting the assessment by the appraisers are entitled to a jury assessment consistent with the proceedings for condemnation of rights-of-way by railroad, telegraph and telephone companies. (Holt-Fla)

DRAINAGE DISTRICTS (4).
W Va Ann, sec 19-21-17 thru 19-21-22 (1966), as amended, (Supp 1968).

Descriptors: *West Virginia, *Drainage districts, *Taxes, *Assessments, Reclamation, Legislation, Administrative decisions, Administration, Construction, Cost-benefit ratio, Contracts, Bids, Benefits, Adjudication procedure, Legal aspects, Financing.

The board of supervisors shall have the power to build and complete all works necessary to carry out the plan for reclamation. The board may let contracts for such works to the lowest bidder who shall give bond for the contract price. The board shall levy a tax on all lands assessed benefits sufficient to pay the cost of completion as shown in the plan for reclamation plus 10 per cent of such cost for emergencies. Such taxes shall constitute a preferred lien on the real property in the district. An annual installment of the total taxes shall be levied thereafter by the board. (Holt-Fla)
W69-08882

DRAINAGE DISTRICTS (5).
W Va Code Ann, sec 19-21-23 thru 19-21-28 (1966), as amended, (Supp 1968).

Descriptors: *West Virginia, *Drainage districts, *Administration, *Taxes, Legislation, Regulation, Assessments, Reclamation, Condemnation, Drains, Alteration of flow, Watercourses (Legal), Natural

streams, Construction, Appropriation, Financing, Budgeting, Compensation, Operation and maintenance.

All bonds issued by the board of supervisors of any drainage district constitute a lien on all lands assessed therein and the board must levy an annual tax as needed to retire the bonds. In order to effect the drainage, protection, and reclamation of the land within the district the board is empowered: (1) to alter drains and watercourses within and without the district; (2) to construct and maintain all necessary works within and without the district; (3) to remove any obstacles within or without the district; and (4) to hold, control and acquire any lands or property interests within or without the district. The right to condemn any land not acquired by the court upon the appraiser's report is given to the board. The board may employ an attorney to act for and advise them. The board may not enter or appropriate any land for works of the district until the price is paid the owner or in the hands of the circuit clerk. (Holt-Fla)
W69-08883

DRAINAGE DISTRICTS (6).
W Va Code Ann, secs 19-21-29 thru 19-21-34 (1966), as amended, (Supp 1968).

Descriptors: *West Virginia, *Drainage districts, *Construction costs, *Ditches, Railroads, Public utilities, Natural streams, Watercourses (Legal), Specification, Construction structures, Boundaries (Property), Boundary disputes, Reclamation, Legislation, Cost allocation, Administrative agencies, Legal aspects.

The cost of constructing any public ditch or drain across any public highway or the right-of-way of any railroad, tramway or other public utility shall be borne by the drainage district. If the ditch follows a natural watercourse and it becomes necessary to enlarge any structure upon said watercourse then such enlargement shall conform to the district's chief engineer's specifications and the expense shall be borne by the county, railroad, tramway or other public utility so involved. The cost of all necessary constructions where said construction does not follow a natural watercourse shall be borne by the district. The cost removing and replacing any structure to enable the passing of any dredge boat or other equipment shall be borne by the district. Specific procedures for the amendment of the plan of reclamation are set forth. Provisions are also included to enable any owner to object to such proposed amendments. (Holt-Fla)
W69-08884

DRAINAGE DISTRICTS (7).
W Va Code Ann secs 19-21-35 thru 19-21-41 (1966), as amended, (Supp 1968).

Descriptors: *West Virginia, *Drainage districts, *Administration, *Financing, Taxes, Drainage, Reclamation, Assessments, Obstruction to flow, Administrative decisions, Ditches, Watercourses (Legal), Legislation, Maintenance costs, Acreage, Legal aspects, Administrative agencies, Costs, Cost repayment.
Identifiers: Penalties (Criminal).

The board of supervisors of any drainage district may issue serial bonds not to exceed 90% of the unpaid taxes levied. Funds from the bonds shall be used to pay the cost of the drainage works and improvements. If the plan for reclamation is deemed inadequate the board may formulate new or amended plans and additional assessments may be made. All ditches and watercourses in existence prior to the inception of the plan for reclamation may be made a part of the works and improvements of the plan at the board's discretion. The circuit court, however, may review the board's discretion. A maintenance tax may be levied annually by the board upon completion of the improvements. Two or more adjacent districts may be united if a majority of the acreage voters approve a petition to unite. It shall be a misdemeanor to obstruct a drain or damage drainage works. (Holt-Fla)

A UNIFIED CABINET-LEVEL DEPARTMENT OF WATER DEVELOPMENT AND OPERATION HAVING FULLY COORDINATED FUNCTIONAL SERVICES TO MEET MODERN NEED,
Shu-t'ien Li.
For 8-Volume Proceedings See Vol 2, No 9, 06B W69-03305. Proc International Conference on Water for Peace, Vol 5, p 365-369, 1967.

Descriptors: *Water resources development, *Planning, *Administrative agencies, *Coordination, Social needs, Governments, Administration, Water policy, Inter-agency cooperation, Adoption of practices, Federal government, Management, Control, Water conservation.

The author proposes that a cabinet-level department of water development and operation be established to fully coordinate the functional services required to meet modern water needs. It is suggested that as a nation becomes more civilized, the more illogical and unstreamlined its governmental agencies for water development and operation become. The major services a cabinet-level department would provide would be: (1) national hydro-data; (2) national hydro-conservation; (3) national water supply; (4) national waste-water sanitation; (5) national reclamation and flood control; (6) national hydroelectric power; (7) waterways, harbors, and maritime administration; (8) water pollution control; (9) interstate water; (10) international cooperation; (11) water development financing; (12) water research and development; and (13) wet space. Under each of these services would be several bureaus handling segments of the services. (Heckerling-Fla)

EXECUTIVE LEADERSHIP AND COMMUNITY INNOVATION: THE FLUORIDATION EXPERIENCE,
State Univ. of New York, Buffalo; and Chicago Univ., Ill.
Donald B. Rosenthal, and Robert L. Crain.
Urban Affairs Quarterly Vol 1 (3), March 1966, 39-57.

Descriptors: *Decision-making, *Fluoridation.
Identifiers: City-Managers, Mayors, Public support.

Utilizing an approach to governmental decision-making which is different from most studies, the authors study the same issue in every case and report the relationship between the public position taken by the Mayor and the outcome of the decision in 362 cities. The author contends that the position taken by the Mayor is crucial in understanding the decision a community makes with respect to fluoridation. In turn, the Mayor is influenced by certain pressures operating in the community, but he is more than a mere pawn in the decision-making process. Mailed questionnaires were sent to local informants, the publisher of the largest local newspaper, the local health officer, and the city clerk in each of 1,186 cities. The central finding is that the position taken on fluoridation by the formal executive leadership (the Mayor or City-Manager) virtually determines the decisions made by the government; if the Mayor does not publicly support fluoridation, there is very little chance for its adoption. The data point out the importance of the Mayor as an important positive cue for voters and as a symbolic leader of the community. One of the factors which seems to play a major part in the City-Manager's stand is the extent of his professionalism, which may create attitudes more favorable toward innovation. The non-professional managers are equally (if not more) willing to support fluoridation when it is not controversial. The professional manager, however, is the main support of the 'cause' when it is controversial. This is consonant with the image of the manager as a man in touch with new developments effecting municip government, and one more likely to have conti ing contact with and respect for technical expe (Fortinsky-Chicago)

DEVELOPMENTS IN THE UNITED NATIO RELATING TO SEA-BED AND OCEAN FLOO
G. Haight.
Nat Resources Lawyer, Vol 11, No 2, p 119-1 May 1969, 12 p. 42 ref.

Descriptors: *United Nations, *International co missions, *International waters, Foreign countri Water resources development, International la Oceans, Continental shelf, Pollution, Beds, Be under water, Mineralogy, Boundaries (Propert Resources, Legal aspects, Resource development

The 23rd session of the General Assembly of t United Nations adopted four resolutions relating resources of the ocean floor beyond the limits present national jurisdiction. The first establishe 42 nation committee, including the United Stat to study the elaboration of principles to promo international cooperation in the use of the resources and to ensure that their exploitation w be for the benefit of all mankind. There is gene agreement that precise boundaries need to be s beyond which no nation may lay claim by use, o cupation, or otherwise, but there is much disagre ment between developed and developing countri over the use of the resources. The developing cou tries are in favor of a 'common heritage' doctri which would ensure that the resources wou redound in considerable measure to their e richment, that economic injury to them would prevented, and that their interests would be a corded major consideration. The second resoluti which deals with the pollution of those resource passed without opposition. The third resoluti requesting the Secretary General to study t establishment of 'appropriate internation machinery' in regard to these resources was o posed by the developed countries as a step towa the 'common heritage' theory. The fourth resol tion relates to an international Decade of Oce exploration under the aegis of the United Nation (Kahle-Flrida)

POLITICAL BEHAVIOR AND THE DECISIO MAKING PROCESS IN THE ALLOCATION O WATER RESOURCES BETWEEN RECRE TIONAL AND MUNICIPAL USE,
Clark Univ., Worcester, Mass.
Roger E. Kasperson.
Natural Resources Journal, Vol 9, No 2, p 176-21 Apr 1969. 36 p, 5 fig, 11 tab.

Descriptors: *Decision making, *Water resource Political aspects, Management, Water supp Legislation, Planning, Water allocation.
Identifiers: *Political behavior, *Water disput Recreational use, Municipal use, Awarene Knowledge, Political behavior, Organization, Sp tial linkage.

Recent research has substantially extended our u derstanding of the ways by which private i dividuals manage a particular natural resource concern with the degree of knowledge and accu cy of perception by the resource manager and t significance of such cognition for the decisio making process is a prominent attribute of the studies. At the same time, however, these resear findings illustrate the key role which the politic system plays in such questions in a modern, ind trial state. The author contends that the speci issue of resource allocation and management a derivatives of more general problems of politic economy. Nevertheless, a corresponding thrust research into the interactions among individ resource users has not been forthcoming. By e amination of one local political conflict over bo the spatial and functional allocation of wa resources, this study seeks (1) to present some i

finding on characteristics of attitudes and ical behavior in a water resource dispute, and to identify a number of larger issues in the ne management of natural resources. (Loeb-ers)

TRANSACTION COSTS, RESOURCE ALLOCATION AND LIABILITY RULES--A COMMENT,
Yale Univ., New Haven, Conn.
Guido Calabresi.
Jour of Law and Ecom. Vol XI, p 67-73, April 1968. 8 p.

Descriptors: *Resource allocation, Joint costs, Welfare.
Identifiers: *Transaction costs, *Bargaining, Legal structures, Short run, Liability rules, Government intervention.

Professor Coase argued that (assuming no transaction costs) the same allocation of resources will come about regardless of which of two joint cost causers is initially charged with the cost, in other words regardless of liability rules. While the author believes this analysis is only correct for the short run, he does believe that it gives an admirable tool for suggesting what kind of empirical data would be useful in making resource allocation decisions and for indicating what kinds of guesses are likely to be justifiably made in the absence of convincing data. This analysis combined with common intuitions as to the relative costs of transactions, taxation, structural rules and liability rules can go far to explain various types of heretofore inadequately justified governmental actions. It can help us to delineate those areas of uncertainty where more facts would help us make better resource allocation judgments. This would also include judgments concerning the allocation of water resources. (Sokoloff-Rutgers)

DELAWARE RIVER BASIN COMPACT.

Del Code Ann tit 7, sec 6501 (Supp 1966).

Descriptors: *Interstate commissions, *River basin development, *Interstate compacts, *Water utilization, Flood control, Flood plains, Hydroelectric power, Hydroelectric plants, Recreation, Water allocation (Policy), Water conservation, Water distribution (Applied), Water permits, Water resources development, Watershed management, Water shortage, Withdrawal, Pollution abatement, Interstate rivers, Project planning.
Identifiers: *Delaware River basin, INCODEL.

The Delaware River Basin Compact between Delaware, New Jersey, New York, Pennsylvania and the federal government sets up an interstate commission (INCODEL) to replace the numerous state and federal agencies previously exercising control over the basin. Each signatory party has one member on the commission, each with one vote. The commission has very broad powers to effectuate a comprehensive plan for development and use of basin resources on its own initiative, plus ultimate approval of all federal, state, municipal and private programs affecting these resources. All projects are to follow a comprehensive plan developed by the commission, supplemented by a more detailed water resources program. Specific areas of concern include development of water uses, pollution control, flood protection, watershed management, development of recreation and hydroelectric power, and regulation of withdrawals and diversions of water. Projects are financed by the parties according to benefits accrued from specific projects, by equitable apportionment among the parties, and by tax-exempt public bond programs. (Douberley-Fla)

ADMINISTRATION OF INTERNATIONAL RIVERS,
Wisconsin Univ., Madison.
I. K. Fox, Hans Gotzman, S. C. Smith, and T. U. Torti.
Paper presented at the United Nations Panel of Experts on Legal and Institutional Implications of Intern. Water Resources Development, December 9-14, 1968, Vienna, Austria, 47 p.

Descriptors: *Administrative agencies, Political aspects, Benefits, Treaties, Rivers, *River basins, Flexible foundations.
Identifiers: National interests.

This paper postulates a set of basic principles which should govern the administration of international river basin programs on the basis of a preliminary evaluation of experience in several different areas of the world. Five premises underlie the analysis: (a) National self-interest will have a powerful influence on the kind of administrative arrangements that are practicable; (b) Each nation will wish to weigh the consequences to it of alternative programs; (c) The full range of relations among the nations involved will influence the response of each nation; (d) The configuration of power and influence within a country will determine the kind of program that country will find acceptable; (e) The rapidity of technological change places a premium upon flexible arrangements. Seven principles emerge from the analysis: (a) Each participating nation must assess opportunities for realizing benefits through independent action; (b) Basic data for joint programs should be cooperatively developed; (c) The evaluation of benefits and costs of alternative joint plans must be undertaken by each nation individually; (d) Administrative arrangements should minimize opportunities for friction or disagreement in program implementation; (e) Administrative arrangements must assure faithful adherence to the agreed-upon program; (f) International treaties should emphasize basic principles rather than program details so as to facilitate changes when needed; (g) Initial agreements should make provision for joint consideration of possible changes as needed in the future. EVALUATION OF FLOOD PLAIN DELINEATIONS BASED ON SOIL MAPS IN THE TURTLE CREEK AND KICKAPOO RIVER WATERSHEDS, WISCONSIN,
Wisconsin Univ., Madison.
Robert M. Viaene.
Univ of Wisconsin Water Resources Center Report, 1969. 97 p. OWRR Project B-002-Wis.

Descriptors: *Flood plains, *Wisconsin, *Watersheds (Basins).
Identifiers: *Turtle Creek (Wis), *Kickapoo River (Wis), *Alluvial soils.

Results of these studies show that the boundaries of alluvial soils coincide most closely with the boundaries of rate floods, as determined by engineering methods, in older, dissected landscapes having well developed flood plains. In order to accurately delineate flood plains from soil maps in most areas, it is necessary to know which soils besides the alluvial soils are subject to flooding. An understanding of the geomorphic basis for the distribution of soils is essential. Stream gradient, land use patterns and the presence or lack of structures must be considered. The approach should be imaginative and interdisciplinary. An understanding of the limitations of different kinds of soil maps and their usefulness for flood plain mapping is also necessary so as to be able to choose the kind of additional infor-

mation that will be needed in particular areas. The use of other information to improve the reliability of soil interpretation does not reduce the value of soil maps for this purpose. Of the sources at hand in most places, soil maps depict the landscape from the broadest interdisciplinary approach. (Lee-Wis)

AN ACTIVITY ANALYSIS OF NON-STRUCTURAL FLOOD PLAIN MANAGEMENT ALTERNATIVES,
Wisconsin Univ., Madison.
John C. Day.
Univ of Wisconsin Water Resources Center Report, 1969. 121 p. OWRR Project B-002-Wis.

Descriptors: *Economic analysis, *Floods, *Nonstructural, Cost-benefit.

This report deals with the economic evaluation of non-structural measures for control of urban flood damages. The research objective was to explore the feasibility of certain quantitative techniques for the economic analysis of spatial land use of flood proofing. A simple linear programming model was developed for residential development in a presently vacant flood plain area. The analytical approach was tested using a small community in a 'demonstration study' framework. Data sources and limitations are discussed. The success of the approach in identifying an economically efficient land use planning response to flood problems is encouraging and indicates that further research is likely to be fruitful. (Author)

THE USE OF SOIL MAPS IN THE DELINEATION OF FLOOD PLAINS,
Wisconsin Univ., Madison.
John M. Cain, and Marvin T. Beatty.
Water Resources Research, Vol. 4, No. 1, February 1968, p 173-182, 9 p, 5 fig, 21 ref. OWRR Proj B-002 Wis.

Descriptors: *Wisconsin, *Mississippi River, Flood plains, River basins, Morphology.
Identifiers: *Soil maps, *Flood plain delineation, Southwestern Wisconsin, Morphology, Alluvial soils.

Soil maps provide a tool for rapid, low-cost delineation of river flood plains, based on the difference in morphology between soils frequently flooded and soils free of flooding. Very rare floods along the Mississippi River inundated over 99 percent of the soils that would be expected to flood but in addition flooded 7 percent of the terrace soils. Flooding predicted with soils information was compared with flooding predicted with an engineering study for small streams in a mature landscape in southwestern Wisconsin. For a 100-year synthetic flood an agreement of plus or minus 4.5 percent was obtained. Comparison of flooding with soil types for a small stream in a recently glaciated landscape in southeastern Wisconsin indicated that alluvial soils flo)d frequently and, in addition, that soils with restricted drainage and soils of fluvial origin also flood frequently. Some of the data are inconclusive, owing to the lack of precise flooding information to serve as a basis of comparison. In areas where man made works do not appreciably alter the stream regimen and where extensive flood plain areas must be delineated, it appears that accurate soil maps, properly interpreted, will give a good estimate of areas subject to flooding. STATISTICAL METHOD OF DETERMINING THE OPTIMUM NUMBER OF MEASUREMENTS OF STREAMFLOW CHARACTERISTICS,
State Hydrological Inst., Leningrad (USSR).
M. L. Ruppert.
Soviet Hydrol: Selec Pap, Issue No 2, p 115-123, 1968. 9 p, 1 fig, 3 tab, 9 ref. Trans Trudy Gos Gidrol Inst, No 150, p 17-28, 1968.

Descriptors: *Hydrologic data, *Statistical methods, *Surveys, *Sampling, Statistics, Estimating, Probability, Variability.
Identifiers: *USSR, Data requirements, Streamflow characteristics.

The theory of random variables is used to solve the problem of determining the amount of data necessary for hydrologic studies. Most hydrologic phenomena are the result of so many poorly understood natural factors that they may be regarded as random functions. Calculation of data requirements is based on determination of the probable error in the average value of a series as a function of the coefficient of variation and the number of measurements. ltivariate statistical methods exist which are logous to most of the univariate tests used in rology. In multivariate statistics, each in-dual can be described by multiple measure-nts thereby freeing the hydrologist from the d to describe a phenomenon by single number. ltivariate methods can estimate the probability roup membership based on such multiple mea-ements, test the equivalence of multidimen-al samples, assess the position of a multiple asurement observation with respect to two or re populations known to be different, estimate minimum number of underlying factors present larger set of correlated measurable variables measure the correlation between two sets of iables or predict one set from the other. Mul-riate techniques can be useful merely as ways of lyzing the dependence among sets of variates f the data are multivariate normally distributed, can statistically test hypotheses concerning itidimensional samples. They allow for a flexi-ty of approach which is more in harmony with nature of many hydrologic problems. Hydrolo-s should use these techniques when appropriate hey may benefit from the advantages of mul-riate statistical methods. (Author)

NEW 'SPHINCTER' CORER WITH A COILLESS PISTON,
CLANT ASW Research Centre, La Spezia (Ita-

Kermabon, and U. Cortis.
rine Geol, Vol 7, No 2, p 147-159, Apr 1969. 13 fig, 3 ref, 2 append.

criptors: *Sampling, *Sediments, *Cores, uipment, Mechanical equipment, Design data, earch and development, Specification.
ntifiers: *Sphincter corers, Piston corer.

'Sphincter' corer developed by Kermabon et al intended as an improvement over most of the ting piston corers. It included the following two inal features: (a) A 'Sphincter-type' nylon core her, which seals the cores within a watertight ainer during retrieval; (b) A split piston, which ents suction of the core when the corer is eved from the sediments. However, this corer the defect inherent to all heavy piston corers after release the piston does not remain sta-ary. A simple system of monitoring the piston ively to a fixed platform lying on the sea floor scribed. The device involves only cables and pulleys and can be installed on any existing 'S-cter' corer. The equipment operates success-and little or no disturbance can be observed in ores. (Knapp-USGS)

ESTIMATE OF THE RELIABILITY OF THE CHARACTERISTICS OF THE SHORTAGE IN SOLID PRECIPITATION DUE TO WIND,
Main Geophysical Observatory, Leningrad (USSR).
E. G. Bogdanova.
Soviet Hydrol: Selec Pap, Issue No 2, p 139-147, 1968. 9 p, 3 fig, 5 tab, 11 ref.

Descriptors: *Precipitation gages, *Snow, *Claibrations, Winds, Precipitation (Atmospheric), Snow surveys, Snowfall, Reliability.
Identifiers: *USSR, Snow gage corrections.

Sources of error in snow gaging are examined and a mathematical description of snow-catch by various gage types is given. Relationships are presented for calculating wind effect on snow gaging. Forests do not have sufficient aerodynamic effect on snowfall to require correction of snow survey data for clearings compared with the surrounding forest. Uncorrected gages in windy areas underestimate snowfall by as much as 100% or more. (Knapp-USGS)

ACTIVATION ANALYSIS: A NEW TECHNIQUE FOR SOIL MOVEMENT STUDIES,
Iowa State Univ., Ames.
Craig E. Beer, and R. A. Hendrickson.
Agr Eng, Vol 50, No 3, p 144-145, Mar 1969. 2 p, 1 fig.

Descriptors: Soils, *Radioisotopes, *Tracers, *Sediment transport, *Isotopes, Movement, Gamma rays, Irradiation, *Sediment distribution, Laboratory tests, Hydrologic cycle, Hydrology.
Identifiers: *Activation analysis, *Lanthanum.

Laboratory test results show that lanthanum used as a tracer element in activation analysis permits detailed study of elements within a hydrologic cycle. In activation analysis, certain elements are irradiated with nuclear particles to produce radioisotopes. By counting the rate of disintegration of these radioisotopes, a quantitative evaluation of the amount of the original element present is possible. A soil-lanthanum test sample mixture was irradiated with thermal neutrons. Analysis showed that over 90% of the lanthanum adhered to the soil. The ultimate objective is to use lanthanum as a tracer element in activation analysis to study the origin and movement of sediments in certain phases of the hydrologic cycle. The procedure will involve mixing lanthanum in soil on a larger scale to produce a seeding batch. The treated soil will then be placed in the field at predetermined points. Sampling will be done immediately after seeding and at points along the flow path. The apparent ability of lanthanum to adhere to inert particles can make its use virtually unlimited. (USBR)

NUCLEAR LOGGING METHODS,
Mobil Research and Development Corp., Dallas, Tex.
Richard L. Caldwell.
Isotop Radiat Technol, Vol 6, No 3, p 257-273, 1969. 17 p, 15 fig, 2 tab, 18 ref.

Descriptors: *Logging (Recording), Borehole geophysics, Radioisotopes, Engineering geology, Gamma rays, Bibliographies, *Geophysics, Geologic investigations, Porosity, Oil-water interfaces, Nuclear meters, Rock properties, Radioactivity techniques, *Radioactive well logging, Rocks, Density, Minerals, Spectrum analysis, Photoactivation, Sediments.
Identifiers: *Gamma-gamma logging, Gamma probes, *Geophysical logging, *Well logging, *Nuclear density meters, *Nuclear probes.

New developments in nuclear logging methods are surveyed, placing emphasis on industrial uses. The discussion includes: (1) natural gamma logs for giving rock lithology, (2) gamma ray scattering for density and for locating concentrations of heavy elements in rocks, (3) neutron logs for porosity determination and oil-salt water differentiation, and (4) combinations of logs for identifying rocks and nonmetallic mineral deposits. Future nuclear logging methods are suggested for lunar and planetary surface analysis, ocean-bottom sediment-density gaging, and photo-nuclear activation of geologic samples. Computer methods are discussed for analyzing complex gamma spectra. (USBR)

AERIAL PHOTOGRAPHY,
Carl H. Strandberg.
Photogr Appl, Vol 2, No 8, 9, 10, p 25-30, 41-47, 23-43, Fall-Winter, Mar 1968-69. 21 p, 31 fig.

Descriptors: *Aerial photography, *Photogrammetry, Remote sensing, Photography, *Photographic equipment, Mapping, Measuring instruments, Water pollution, Photographs, Water pollution control, Optics, Optical instruments.
Identifiers: *Photointerpretation, Photomaps, Optimum crop yield, Resolution, Water pollution surveillance system.

Any photograph obtained from the air may be called an aerial photograph, but modern terminology frequently restricts this term to precise, high resolution photographs obtained from extreme altitudes. The first of this 3-part series is an introduction to aerial photography, including techniques and equipment. Some basic advantages of aerial photography are: location of the vantage point, resolution far superior to the unaided human eye, perception outside the visible spectrum, permanency, and geometric fidelity. The second part covers the state of the art of viewing equipment technology, projection interpretation, stereo projection, electronic viewing systems, application of filtering and multiband techniques in picture taking, and photogrammetric mapping. Two nonmilitary applications of photointerpretation and photogrammetry that may have a profound impact on our civilization are discussed. These applications are providing assistance in feeding the world's hungry millions and in the field of human health, particularly water pollution. (USBR)

BIBLIOGRAPHY OF REMOTE SENSING OF EARTH RESOURCES FOR HYDROLOGICAL APPLICATIONS,
Geological Survey, Washington, D.C. Water Resources Div.
Rita K. Llaverias.
Geol Surv Open-file Rep, Sept 1968. 73 p, 4 ref. NASA-TM-X-61717.

Descriptors: *Bibliographies, *Documentation, *Remote sensing, *Hydrologic aspects, *Application methods, Earth (Planet), Aerial sensing, Cameras, Infrared radiation, Photography, Satellites (Artificial), Application equipment, Appraisals, Mapping, Methodology.

Identifiers: *Basic literature, *Earth resources, NASA.

This preliminary bibliography was prepared to acquaint hydrologists with the basic literature involved in this field. Some of the references concern specific hydrologic topics or specific remote sensing methods. Other references on vegetation mapping and geology were included so that the reader can find information on the selection, processing, and use of remote sensing data in these cognate fields. A number of meteorological references were included because in many remote sensing applications, especially from earth orbital satellites, atmospheric effects must be taken into account in interpreting the views of the earth. FORTRAN IV PROGRAM FOR SYNTHESIS AND PLOTTING OF WATER-QUALITY DATA,
Geological Survey, St. Paul, Minn.; and Geological Survey, Lawrence, Kans. Water Resources Div.
Leverett H. Ropes, Charles O. Morgan, and Jesse M. McNellis.
Kans State Geol Surv Spec Distribution Publication No 39, 1969. 59 p, 8 fig, 1 tab.

Descriptors: *Computer programs, *Water quality, *Data processing, Hydrologic data, Chemical analysis, Water chemistry, Digital computers, Analytical techniques.
Identifiers: Water quality data processing, Data plotting.

A FORTRAN IV program synthesizes data from the U.S. Geological Survey's water-quality cards. Line-printer output consists of tables and 2 semilog graphs in which the distribution and the minimum, mean, and maximum values of selected group of data are given. The 2 graphs represent front and top orthographic projections of a 3-dimensional array of data. The user selects (1) up to 16 variables, (2) data sorting according to multiple criteria such as aquifer and ranges of values of selected variables, (3) ion concentration units, (4) order of plotting, (5) log scale of the graphs, and (6) option of top-view graph. The program is operational on the GE 635 computer at The University of Kansas Computation Center (program designation: ROPES) and the U.S. Geological Survey's IBM 360/65 program library disc (program designation: DO160). MODIFIED PIPER DIAGRAMS BY THE DIGITAL COMPUTER,
Geological Survey, Lawrence, Kans. Water Resources Div.
Jesse M. McNellis, and Charles O. Morgan.
Kans State Geol Surv Spec Distribution Publication No 45, 1969. 36 p, 2 fig, 1 tab, 9 ref, 3 append.

Descriptors: *Computer programs, *Data processing, *Hydrologic data, *Water quality, *Kansas, Water chemistry, Aqueous solutions, Water analysis, Chemical analysis, Digital computers.
Identifiers: *Piper diagrams.

Piper diagrams, used as aids in interpreting quality-of-water data, are produced accurately and efficiently by a digital computer. The computer produces the 2 triangular cation and anion diagrams and a square-grid modification of the original diamond-shaped diagram. Seven diagrams comprise the output from a quality-of-water data group. Three diagrams are square and the points plotted represent program-assigned sample identification numbers, aquifer identification numbers, and average position by aquifer number, respectively. Four diagrams are triangles to include cation and anion representations with sample and aquifer identification numbers. (Knapp-USGS)

ON THE USE OF POWER FLOW MODELS FOR SYSTEM PLANNING AND OPERATIONS,
Bonneville Power Administration, Portland, Oreg.; and Wolf Management Services, Palo Alto, Calif.
William F. Tinney, and John Peschon.
Pap, Thirty-first Annu Amer Power Conf, Chica Ill, Apr 1969. 13 p, 3 fig, 2 tab, 20 ref.

Descriptors: *Power system operations, *Electri studies, Computers, Models, *Mathematical ana sis, *Optimum development plans, Planning, El tric power production, Transmission (Electric Electrical networks, Electric power dema Forecasting, Reliability, Economics, Bibliog phies.
Identifiers: *Systems engineering, *New Method, Load flow, Cost savings, Power syst stability, Optimum performance.

A description is given of recent research of n computer-based procedures for power syst planning and operation. The most common proach consists of running as many power-flow s dies as are believed necessary to ensure syst security and economy. Until recently, power-fl computations for large systems were slow, unrel ble, and costly. The introduction of Newto Method with ordered triangular factorization a special programming techniques has greatly creased the efficiency of these programs. Much this increased efficiency has been offset by many trial and error runs performed for the sake conscientiousness. Direct methods for analyz the optimizing phases of power system operati and planning are introduced. The computer p forms an organized and efficient search over a la number of alternatives and retains the optimum ternative. Direct methods can be formulated problems of mathematical programming in wh the power-flow equations enter as equality co straints. The power-flow model remains at center of all power system computations be developed. (USBR)

EDWARD HYATT POWERPLANT INTAKE STRUCTURE,
Parsons, Brinkerhoff, Quade and Douglas, N.Y.
Paul H. Gilbert.
Proc Amer Soc Civ Eng, J Power Div, Vol 95, No PO1, p 101-118, Mar 1969. 18 p, 18 fig, 7 ref, append.

Descriptors: Corrosion control, Corrosion, Hydroelectric plants, Water quality, Hydroelectric power, Environmental effects, *Intake structures, Environmental engineering, *Intake gates, *Intakes, Hydraulic machinery, Penstocks, Pumped storage, Stainless steel, Structural steel, Hydraulic gates, *Temperature control, Powerplants, Trash racks.
Identifiers: Corrosion resistance, Corrosion resistant alloys, *Oroville powerplant (Calif).

A major component of the 644-megawatt Oroville Powerplant on the Feather River in California is the sloping, multilevel, temperature-controlling intake structure. This intake is capable of providing the powerplant with over 16,500 cfs of water. The intake provides temperature control of water passing through the powerplant and downstream. Control is required to avoid damage to downstream agricultural, recreational, and fishlife interests. The intake can vary the temperature of the powerplant discharge by as much as 25 deg F. Submerged portions of the intake are designed for a pressure differential of 5 ft of head. The low design of 5 ft was made possible by utilizing special relief panels built into the intake system, limiting effects of overpressure to less than the 5-ft value. Stainless steel was used as a structural material for the trashrack system, the first such use in a major hydroelectric installation. Corrosion resistance of this material makes it ideally suited for use in an application involving a corrosive medium, inaccessibility, and strict structural requirements. In this case, using stainless steel was the most economical solution. (USBR)
W69-08836

VIBRATION ANALYSIS OF PUMP DISCHARGE LINES,
California State Dept. of Water Resources, Sacramento; and Development and Water Resources Corp., Sacramento, Calif.
Jesse M. Diaz, and Ravinder K. Jain.
Pap, Amer Soc Civ Eng Nat Meet Water Resour Eng, New Orleans, La, Feb 1969. 40 p, 6 fig, 1 tab, 16 graph, 6 ref, append.

Descriptors: *Discharge lines, *Pumps, Pumping plants, *Vibrations, Resonance, Pipelines, Natural frequency, Pressure, Kinetic energy, Velocity, Oscillation, Deflection, Analysis.
Identifiers: *Pipeline surges, *Stiffeners, *Vibration control, Amplitude, Propagation.

A method for determining the critical spacing for stiffener rings on exposed pump discharge lines under internal pressure is outlined. The analysis includes all parameters affecting the natural frequency of a discharge line. Using stiffener rings is not the only method of preventing vibrations in discharge lines, but is normally the most convenient for controlling or correcting vibrations in existing installations. Stiffener rings are assumed to act as simple supports that are free to rotate. This assumption is conservative and results in no great sacrifice to the economy of the project. Calculations made on the basis of a shell of infinite length whose bending stiffness is determined by the stiffeners acting with an effective length of the shell indicate the cross-section size of required stiffeners to be smaller than practical from a fabrication standpoint. Stiffeners rectangular in cross section that are large enough to satisfy fabrication requirements should be used, the minimum size being approximately 6 in. by 1/2 in. A criterion for avoiding resonant conditions in pipelines is given. (USBR)
W69-08838

HIGH ARCH DAMS IN THE WEST; MODERN TRENDS AND STATE OF THE ART,
International Engineering Co., Inc., San Francisco, Calif.
Gurmukh S. Sarkaria.
Pap, West Water Power Symp, ASCE, ASME, IEEE, p A-135-A-151, Apr 1968. 17 p, 9 fig, 1 tab, 9 ref.

Descriptors: *Arch dams, *Concrete dams, Concrete construction, Stress analysis, Concrete placing, Safety, Safety factors, *Dam design, Design criteria, Foundation investigations, Monoliths, Spillways, Underdrains, Geometric shapes, Engineering geology, Lifts (Construction), Mass concrete, Dam foundations, Aesthetics.
Identifiers: *Western United States, Double-curvature arch dams, Site selection, Design practices, Bullards Bar (Calif), Allowable stress.

Seven arch dams over 350 ft high have been built in the Western United States during the last 11 yr. Current trends indicate better utilization of wider and unsymmetrical sites, acceptance of higher stresses, and greater reliance on the inherent structural stability of an arch dam. A well-engineered arch dam with adequate foundation support, in comparison with other types, has substantially larger overall margins of safety against failure caused by structural rupture, leakage through the dam, and accidental or planned overtopping of either the fully or partially completed structure. Structurally, the arch represents the most economical and effective utilization of concrete and its strength properties to develop a safe dam. Recent emphasis on aesthetics of public facilities has enhanced prestige of the arch dam because it is unmatched for elegance, graceful lines, and beauty. Other factors that reflect present, and will influence future, arch dam engineering practices are the recognition of such advantages of this type of dam as simpler river diversion, safe overtopping during construction, shorter penstocks through the dam, and the possibility of storing water behind a partially complete dam. New Bullards Bar Dam in California is a typical example of current design and construction practices. (USBR)

8B. Hydraulics

ON THE REFLEXION OF WAVE CHARACTERISTICS FROM ROUGH SURFACES,
Oregon State Univ., Corvallis.
M. S. Longuet-Higgins.
J Fluid Mech, Vol 37, Part 2, p 231-250, June 23, 1969. 20 p, 12 fig, 10 ref. Supported by grant from NSF.

Descriptors: *Waves (Water), *Refraction (Water waves), *Roughness (Hydraulic), Energy, Frequency, Wavelengths, Mathematical studies, Viscosity, Turbulence, Shear, Mixing, Absorption.
Identifiers: *Water wave reflection.

The energy of internal waves tends to be propagated alon certain characteristic paths inclined at fixed angles to the vertical direction, depending only on the wave frequency and the density stratification, not on the wavelength. The role of surface roughness is examined. It appears that small-scale irregularities can completely alter the reflecting properties of a surface; the tangential scale of the roughness elements may be much smaller than the wavelength of the incident or reflected waves. All scales of roughness are relevant, down to those comparable in magnitude to the thickness of the oscillatory boundary layer. For tidal waves in the ocean this thickness is of the order of 1 m. The behavior of the coefficient of transmission as a function of the angle of incidence appears at first sight to be extremely complicated. Some simple examples of periodic surface roughnesses are discussed and elucidated: a sawtooth, a square-topped wave and a simple sine wave. An approximate expression is also derived in the case of a slowly modulated sine wave. These results are for a non-viscous fluid. The effects of

viscosity are also considered qualitatively. (Knapp-USGS)
W69-08717

SURFACE TENSION IN FROUDE MODELS,
Illinois Univ., Urbana.
W. Maxwell, Richard J. Weggel, and C. Hall.
Proc Amer Soc Civ Eng, J Hydraul Div, Vol 95, No HY2, p 677-701, Mar 1969. 25 p, 9 fig, 1 tab, 8 ref, 3 append.

Descriptors: *Froude number, *Surface tension, Fluid flow, Hydraulics, *Hydraulic models, Reynolds number, Viscosity, Spillways, Free surfaces, Weber number, Weirs, Vee-notched weirs, Rectangular weirs, Uniform flow, Experimental data, Energy equation.
Identifiers: Experimental models, Ogee crests, Bureau of Reclamation, Surface energy, Corps of Engineers.

A criterion for avoiding surface tension effects in Froude models is obtained analytically for uniform flows. Experiments show that surface tension does not limit the scale in curvilinear flow Froude models. In uniform flows, the least scale is determined by instrumentation accuracy and Froude number or by the need to exceed a limiting Reynolds number. The least scale is found by including a surface energy term in the energy equation or by considering the celerity of small free-surface disturbances. The scale is chosen so that experimental reading error scatter will mask any dependence on surface tension. Experiments on 3 weir geometries, for which flow at one head is interpreted as an imperfect Froude model of flow at a different head, are used to examine surface tension effects in Froude models of curvilinear flows. The viscosity was kept nearly constant and the surface tension varied using an additive. Variations caused by surface tensions are masked by the inherent scatter of data. (USBR)
W69-08851

SURGE STUDIES FOR PORTAGE MOUNTAIN TAILRACE SYSTEM,
Ingledow (T.) and Associates Ltd., Vancouver (British Columbia).
Kenneth C. Wilson.
Proc Amer Soc Civ Eng, J Power Div, Vol 95, No PO1, p 1-16, Mar 1969. 16 p, 7 fig, 1 ref, 2 append.

Descriptors: Hydraulic models, Hydraulics, Hydroelectric plants, Hydroelectric power, *Open channel flow, *Surges, *Tunnels, Head loss, *Waves (Water), Discharge (Water), Discharges, Digital computers, Foreign research, Laboratory tests, Hydraulic transients.
Identifiers: *Surge waves, *Portage Mtn Pwrplt (Can), Traveling waves, Canada, Foreign testing, Test results.

The discharge from the underground powerhouse at Portage Mountain, Canada, rejoins the Peace River through 2 large free-flow tunnels. Surge waves in these tunnels, caused by changes in turbine discharge, were studied by: (1) approximate manual calculations, (2) computer analysis, and (3) model testing. The surges are considered under 2 headings: determination of the initial extreme level following a flow change, and the more complicated conditions occurring after the return of surge waves reflected at the tunnel exit. Procedures used for manual and computer calculations are based directly on the momentum and continuity relationships because the great variation in surface breadth with the water level precludes using standard methods for surges in open channels. The tunnels are hydraulically short, permitting the configuration to be approximated by a level tunnel with friction losses lumped at the entrance and exit. Comparing results of the 3 methods of surge study indicates very satisfactory agreement. (USBR)
W69-08852

HYDRAULIC PERFORMANCE OF PENSTOCK TRIFURCATIONS,
Roorkee Univ. (India); and Birla Inst. of Technology and Science, Pilani (India).
Palepu V. Rao, H. C. Misra, and R. V. Juyal.
Proc Amer Soc Civ Eng, J Power Div, Vol 95, No PO1, p 35-53, Mar 1969. 19 p, 18 fig, 4 tab, 9 ref, 2 append.

Descriptors: *Penstocks, Energy dissipation, Energy losses, Models, *Hydraulic design, Hydraulic conduits, Hydraulics, Pipe bends, Model tests, Pressure distribution, Reynolds number, Velocity distribution, Cavitation, Foreign research.
Identifiers: Test results, *Trifurcations, Foreign testing, India.

Pressure distributions and energy losses were obtained in an air tunnel for the following penstock trifurcations: a 2-wye arrangement, 2 types of plug-funnel proposal, and an abrupt junction. Results of model studies of the tie bar trifurcation and other wyes are included to provide a comprehensive aid in selecting the right type of trifurcation. Model tests were made for 3 operating conditions: one branch flowing, 2 branches flowing, and all 3 branches flowing. Within the range of Reynolds numbers tested, the coefficients of the energy loss are independent of the Reynolds number. The plug-funnel trifurcation (central portion recessed) is hydraulically better than the other models tested when all 3 branches are flowing because the boundary geometry provides a smooth entry into all 3 branches. The double wye is superior when only one branch is flowing. (USBR)

8C. Hydraulic Machinery

THE PROBLEM OF FRAZIL ICE IN WATER INTAKES,
Laval Univ., Quebec.
B. Michel.
Pap, Univ Laval, Can, 15 p, 1963. Transl from Fr, Bur Reclam Transl 698, Apr 1967. 21 p, 11 fig, 9 ref.

Descriptors: *Frazil ice, Water temperature, *Intakes, Grills, *Intake structures, *Trash racks, Research and development, Heating, Hazards, Screens, Hydroelectric plants, Hydraulic turbines, Turbines, Foreign research.
Identifiers: Electric heating, Canada, Clogging.

Frazil ice can be a serious hazard to the operation of hydroelectric powerplants. Studies were made at Laval University, Canada, on the nature of frazil ice and methods of combatting it. Frazil ice can obstruct intakes by: (1) adhering as active frazil (frazil in the early stage of formation) to trashracks and grillwork, even to the bottom of the intake structure; (2) blocking as inactive frazil (older frazil that has lost its adhering characteristics but has formed into larger flakes and small plaques of ice) the partially obstructed openings by arching action; and (3) progressively clogging the turbines with active and, later, inactive frazil and producing shutdown of the hydroplant for the winter. Reservoir intakes should be located beneath the water in a manner to avoid frazil that could appear because of wind effect before surface icing. River intakes should not be located in rapids or immediately below rapids where frazil could form beneath a partial ice cover. Trashracks and grillwork should be equipped with heating capability for operation well before the appearance of active frazil ice. (USBR)

THE INFLUENCE OF STATION DESIGN C CONTROL CIRCUIT TRANSIENTS,
General Electric Co., Philadelphia, Pa.
W. C. Kotheimer.
Pap, Thirty-first Annu Amer Power Conv, A 1969. 18 p, 4 fig, 10 ref.

Descriptors: *Extra high voltage, *Substatio (Electrical), Control, *Electromagnetic wav Switchyards (Electrical), Electromagnetic shie ing, *Interference, Circuits, Electric relays, B (Electrical), *Transients, *Electrical design, Co ductors, Magnetic fields, Shielding, Electric grounding.
Identifiers: *Ultra high voltage, *Induced voltag Switching surges, Control equipment, Protecti (Electrical), Magnetic links.

In ehv substations, interference originating duri operation of a switching device can cause prote tive and control equipment to be damaged or operate falsely. This phenomenon is electroma netic interference, and control circuit transie present during switching operations have be measured in the thousands of volts. Fundamen principles of electromagnetic interference a discussed, relating them to factors in station desi that can be manipulated to minimize control circ transients. The 4 basic conditions that must present to cause electromagnetic interferenc surges, or control circuit problems are reviewe Station design, proper shielding of control circui and coupling between ehv circuits and control c cuits are very important as system voltages increa to the 765- and 1000-kv level. Transients in contr circuits have been related in severity to the thi power of the system voltage; transient levels 1000-kv stations could be 8 times those present 500-kv stations unless additional precautions a taken during design. Identifiers: *Shunt reactors, Overvoltage, *Ult high voltage, Switching surges, Protection (Elect cal).

Shunt reactor technology, including design, testi and application, is very important in the investme and operation of ehv and uhv transmission syster The transmission voltage levels employing compe sation cover the spectrum from 115 kv through 7 kv, with the majority of the approximate 15,000,000 kvar of installed or planned reacto applied on 345-kv and 500-kv systems. Reactor a plications are almost evenly divided between inst lations at line voltage and reactors on tertia windings of transformers, normally transmission-autotransformers. Continuing requirements shunt reactors indicate the necessity of defining a plication and testing practices and the econom of various compensation schemes. An analysis o reactor installation is given, indicating the necess of economic analysis when applying shunt compe sation. System requirements, reactor design, re tor testing, switching protection, and installat economics are discussed. (USBR)

MINATION OF LATERAL PRESSURES
IATED WITH CONSOLIDATION OF
LAR SOILS,
of Public Roads, Washington, D.C.
Vladimir F. Obrcian.
Pap, U S Dept Transp, Fed Highw Admin, Bur Public Roads, Jan 1969. 31 p, 13 fig, 2 tab, 13 ref.

Descriptors: *Consolidation, *Cohesionless soils, Soil tests, Poisson ratio, Soil properties, *Soil compression tests, Soil density, Friction, Soil mechanics, Laboratory tests, Test procedures, Prestressing, Stress, Strain, Loading rate, Preconsolidation.
Identifiers: *At rest pressure, Consolidometers.

One-dimensional consolidation of 4 granular soils was studied to determine the coefficient of earth pressure at rest, k sub zero. The consolidation apparatus permits gradual load application at a specified rate, while vertical and lateral stresses are observed simultaneously under the controlled condition of no lateral yielding. Load history of the deposit was simulated by vertical loading and unloading cycles. The soil specimens had a range of gradations and compactness commonly encountered in natural soils. Data demonstrate that k sub zero is less for the dense state than for the loose state and that it decreases with higher consolidation stress levels. Influence of gradation is also apparent from the results, but less pronounced. Approximate values of Poisson's ratio were computed from the data. The stress history studies, simulated by performing a number of unload and reload cycles starting at 3 different consolidation stress levels, demonstrated the locked-in or residual stress phenomenon associated with consolidation of soils subjected to cyclic loading. These studies emphasize the importance of considering the stress conditioning of soils that may be caused by the rolling of embankments or pavement layers. (USBR)

ANALYSIS AND DESIGN OF TOWER FOUNDATIONS,
Texas Power and Light Co., Dallas.
Richard L. Wiggins.
Proc Amer Soc Civ Eng, J Power Div, Vol 95, No PO1, p 77-100, Mar 1969. 24 p, 12 fig, 8 ref, 2 append.

Descriptors: *Footings, Foundations, *Transmission towers, Analysis, *Design criteria, Compression, Horizontal loads, Lateral forces, Soil mechanics, Testing, Reinforced concrete, Substations (Electrical), Cohesive soils, Soil pressure, Soil tests, Loads (Forces), Cohesionless soils, Transmission lines.
Identifiers: Uplift footings, *Auger-type footings, *Belled footings.

A comprehensive set of design procedures for drilled shaft-type tower foundations is presented. An analysis of various soil types, soil testing procedures, and interpretation of field and laboratory test results is included. Procedures are developed separately for horizontal shear, compression, and uplift in various soil types. The structural design of the reinforced concrete shaft for combined uplift and bending is presented as well as cases involving compression at extremely high eccentricities. Computer-generated design aids are presented, offering some relief from tedious calculations. Two simple design problems illustrate the developed procedures. The material and procedures presented should help in analyzing and designing foundations for transmission lines and substations. (USBR)

UPLIFT TEST ON AN ANCHOR BAR FOOTING - MEAD-LIBERTY TRANSMISSION LINE - PACIFIC NORTHWEST-PACIFIC SOUTHWEST INTERTIE,
Bureau of Reclamation, Denver, Colo.
James M. Horner.
Bur Reclam Rep No EM-765, Feb 1969. 38 p, 23 fig, 7 tab, 4 ref.

Descriptors: Foundations, Penetration resistance, Field tests, Shear strength, Soil properties, *Footings, Construction, Cohesive soils, Transmission towers, *Movement, Soil mechanics, Soil tests, Inspection, Loads (Forces), Arizona, *Loading rate.
Identifiers: Pacific Northwest-Southwest Intertie, Uplift resistance, Mead-Liberty Transmission Line, Anchored footings, Loading tests.

A full-size test to determine the movement of an anchor bar transmission tower footing under load was performed near Kingman, Ariz. The anchor bar footing consists of a reinforced concrete cap with 4 anchor bars (reinforcing bars surrounded by grout) extending out of the cap base downward into the soil. At the failure movement of 1/2 in., the uplift load was about 30 kips and the maximum uplift load resisted was 48 kips. Most footing movement was caused by rotation rather than translation. The soil resisting the footing movement was a sandy silt and a lean clay. For an individual anchor bar, soil strength values indicated that about 3.5 kips could be resisted, while a static analysis indicated that about 8.2 to 10.7 kips were actually resisted. The difference between computed and actual loads is attributed mainly to the following factors not included in the computations: (1) the direction of the load was oblique to the axis of the anchor bar, and (2) a 1-1/2-ft section of the grouted hole in a sand and gravel layer had an enlarged diameter. The analysis was complicated because the bottom one-third to one-half of the anchor bar reinforcements extended into soil outside the grouted holes. (USBR)
W69-08857

STABILITY OF DAMS IN PERMAFROST AREAS,
Alaska Univ., College.
Donald J. Gotschall.
Pap, Arctic Eng Class, Univ Alaska, Dec 1968. 14 p, 1 fig, 7 ref.

Descriptors: *Permafrost, Frost, Frost action, Frost heaving, Frozen ground, Frozen soils, Dam construction, Dam design, *Earth dams, Outlet works, *Rockfill dams, Heat flow, Dam foundations, *Stability, Cold weather construction, Spillways.
Identifiers: *Frozen core dams, USSR, Norway, Canada.

Stability of earth or rockfill dams built in permafrost areas requires that as much attention be given to the heat flow through a dam as is given to stopping the flow of water through a conventionally built dam. Heat flowing around abutments or through a frozen foundation will result in thawing the ice-soil mixture into a liquified state and invite failure. Earth dams have been built successfully in the arctic with and without frozen cores and on frozen and unfrozen foundations. Examples are given of permafrost dams built in the U S, Canada, Russia, and Norway. From the limited experience throughout the world, stability of earth and rockfill dams in a permafrost area is not an insurmountable problem. Heat flow through a zoned earthfill dam can be analyzed with an instrumented model or an analog computer. Rockfill can be used in the contact between frozen and thawed zones since rockfill drains easily and is not subject to movement when frozen. Other unusual construction and design techniques that have been used in permafrost are discussed. (USBR)
W69-08862

SLOPES IN STIFF-FISSURED CLAYS AND SHALES,
California Univ., Berkeley.
James M. Duncan, and Peter Dunlop.
Proc Amer Soc Civ Eng, J Soil Mech Found Div, Vol 95, No SM2, p 467-492, Mar 1969. 26 p, 20 fig, 3 tab, 44 ref, 2 append.

Descriptors: *Clays, Overconsolidation, Safety factors, *Shales, Shear stress, *Slope stability, Soil mechanics, Shear strength, Displacements, Stress analysis, Fissures, Computer programs, Normal stress, Pore pressure, Bibliographies, *Slopes.
Identifiers: Progressive failures, At rest pressure.

Case histories and probable causes of slope failures in stiff-fissured clays and shales are reviewed; analyses for determining the influence of initial stress conditions on stresses around excavated slopes are described. These analyses show that initial horizontal earth pressures have considerable influence on the magnitudes of shear stresses following construction. Shear stresses around excavated slopes are much larger for conditions representing a heavily overconsolidated clay (high initial horizontal stresses) than for conditions representing a normally consolidated clay (low initial horizontal stresses). Results indicate that shear stresses large enough to cause failure may develop at some points within the slopes, even though the factor of safety (according to the usual phi sub u= zero method) is considerably greater than unity. The higher the horizontal stresses before construction, the higher the factor of safety corresponding to development of local failure around the slope. The existence of high horizontal stresses in heavily overconsolidated clays and shales increases the probability of progressive failure in these materials. (USBR)

CORRELATION OF RAPID HYDROMETER ANALYSIS FOR SELECT MATERIAL TO EXISTING PROCEDURE LDH-TR-407-66,
Louisiana Dept. of Highways, Baton Rouge.
George W. Bass, and Marrion M. Cryer, Jr.
Res Proj No 67-1S, La Dept Highw, May 1968. 17 p, 6 tab, append.

Descriptors: *Gradation, *Gradation analysis, *Grain sizes, Base courses, *Hydrometers, Soil tests, Soil texture, Soil treatment, Soil classifications, Soil cement, Soil physical properties, Soil mechanics, *Laboratory tests, Statistical analysis, Soil stabilization, Test procedures.
Identifiers: Cement content.

The Louisiana Department of Highways has developed a standard procedure for rapid hydrometer analysis of soil samples to determine particle size distribution. The procedure will provide information in 24 hr instead of the 2-1/2 days required for former methods. Particle size distribution is needed for determining cement content for portland cement stabilized bases. The procedure requires removing material retained on the No. 4 and No. 10 sieves. Standard 100-g samples are ovendried and then mixed by hand with a stock solution of sodium hexametaphosphate buffered with sodium carbonate. The sample is washed into the dispersing cup and distilled water added. Dispersion by a mechanical stirring apparatus for 5 min precedes pouring the sample into 1000-ml sedimentation cylinders. Hydrometer readings are taken at 60 and 120 min. The sample is then washed over No. 40 and No. 200 mesh sieves and the retained material dried and weighed. Comparison with the standard laboratory method indicates equal accuracy and repeatability. (USBR)

8E. Rock Mechanics and Geology

PREVENTING QUARRY ROCK FALLS,
R. M. Belliveau.
Pit Quarry, Vol 61, No 9, p 130-134, Mar 1969. 5 p, 6 photo.

Descriptors: *Rock excavation, *Rockslides, Quarries, *Quarrying, Rock properties, Mining engineering, Sliding, Slopes, *Engineering geology, Slope stabilization, Landslides, Geologic investigations, Safety.
Identifiers: *Rockfalls, *Rock slope stability, Rock competency, Open pit mining, Geologic defects, Benches.

Initial planning of quarry layout and operations is essential in preventing rock falls. Rock falls are manmade, resulting from deficient planning and inefficient operation. Geologic and mining engineering aspects are discussed for safe quarrying. Slides are usually caused by discontinuities in rock formations, such as bedding and faulting. Blasting disturbs the rock and induces slides. Operating practices are responsible for most situations resulting in slides and rock falls. Bench heights of 30 ft are recommended for ordinary operations; heights over 50 ft should not be used unless required by special considerations. In well-designed operations, the cost of mining high benches is greater than mining benches of 30 ft maximum height. (USBR)

ANCHORAGE PERFORMANCE IN ROCK BOLTING,
Pennsylvania State Univ., University Park.
R. Stefanko, and D. S. Choi.
Prepr 69-F-61, Annu Meet Amer Inst Mining, Washington, D C, Feb 1969. 23 p, 9 fig, 7 ref

Descriptors: *Rock bolts, Rock mechanics, Roof supports, Coal mines, Rocks, *Underground structures, Slipping, Suspension, Friction, Field tests, Laboratory tests, Design criteria.
Identifiers: Expansion bolts, Rock grip resin pack, Pull-out tests, Anchor bolts, Underground openings, Suspended structures.

Laboratory, field, and analytical investigations are described for designing rock bolts for a suspended monorail transportation system in an anthracite mine. Theoretical analysis of expansion shell anchorage was made to determine the yield of rock, the friction on the interface between the plug and expansion shell leaves, and the friction between the rock and leaf serrations. Serrations on the surface of expansion leaves increase friction, but may produce high stresses in the rock, causing failure and subsequent slippage. The analysis shows that the spacing between serrations is too small in most commercial shells. Laboratory tests gave widely varying bleedoff and installed load values for different rock and shell combinations, and substantiated the theoretical analysis that a reversal of serrations would improve anchorage. The variability in underground conditions prevents assessment of design parameters; field tests are necessary. With the present state of the art, pull tests and long-term bleedoff studies are essential for determining the best bolt assembly for a specific application. Field tests are discussed for roof bolts suspending the underground monorail, and bolt performance is being monitored periodically during operation.

DESIGNING FOR CORROSION RESISTANCE,
Du Pont de Nemours (E. I.) and Co., Wilmington, Del.
R. James Landrum.
Chem Eng, p 118-124, 172-180, Feb-Mar 1969. 9 p, 22 fig, 7 ref.

Descriptors: Corrosion, *Corrosion control, Design, Butt joints, Steel structures, Fillet welds, Design criteria, Materials engineering, Steel, Materials failures, *Welding, Stainless steel, Temperature, Fabrication, Heat treatment, Fluids, Lap joints.
Identifiers: Corrosion environments, Corrosion resistance, Galvanic corrosion, Design practices, *Welds.

Corrosion resistance and service life under corrosive conditions are affected by construction materials, specifications, fabrication and inspection, operation, maintenance, and design. Service life is usually estimated from the corrosion resistance of the materials selected as determined by corrosion tests. Too little attention is paid to the effects of design details and other factors influencing corrosion, which can lead to early failures. A careful study of designs can detect design defects and find ways to avoid corrosive situations. Design details affecting corrosion are crevices, welding procedures, galvanic couples, heat treatment, environment, fluid drainage, velocity, and temperature. Designing for adequate performance at the lowest cost requires good judgment from the designer and the materials engineer. The materials engineer should work closely with the designer in selecting materials and design details to assure corrosion resistance. (USBR)

8H. Rapid Excavation

SUCCESSFUL OPERATION OF THE HABEGGER TUNNEL-BORING MACHINE IN HARD ROCK,
Habegger Machine Manufacturing Corp.
E. Lauber, and H. W. Brodbeck.
Schweiz Bauztg, Vol 86, No 51, p 917-924, Dec 1968. Transl from Ger, Bur Reclam Transl 812, Apr 1969. 21 p, 14 fig, 2 tab.

Descriptors: Tunnels, *Tunneling machines, *Tunneling, Engineering geology, Hardness tests, *Tunnel construction, Rock excavation, Slates, Rock properties, Rocks, Geologic investigations, Hardness, Conveyors, Quartz, Muck, *Boring machines, Foreign construction, Pressure tunnels, Sandstones.
Identifiers: Switzerland, Juliawerk Tiefencastel Proj (Switz), *Cutters.

The Habegger hard-rock tunneling machine was used in boring the high-pressure water tunnel for Juliawerk Tiefencastel Project, Switzerland. Experiences in tunneling, machine operation, and rock cutting are discussed. Improvements in designing cutters and developing cooled cutters are described. The machine steering system and a helium laser directional guide held horizontal and vertical deviations within 4 cm over 800 m. A scraper conveyor system was modified to successfully leave a clean floor while working in ground water. Comparing mechanical with conventional tunneling indicated that rock excavation costs are approximately equal. Problems of what is hard rock in regard to tunneling machines, rock properties for evaluation of rock cutting, and wear of cutters are covered. (USBR)

NOVEMBER 15, 1969

W69-09029 -- W69-09446

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 2, NUMBER 22
NOVEMBER 15, 1969

W69-09029 -- W69-0944(

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

YDROLOGIC CYCLE OF NORTH AMERICA ORMULATED BY THE ANALYSIS OF ATER VAPOR TRANSPORT DATA,
onnecticut Univ., Storrs.
urbachan P. Malhotra.
D Diss, Conn Univ, 1969. 159 p, 79 fig, 16 tab, ref, 1 append.

escriptors: *Hydrologic budget, *Hydrologic cy-e, *Climatology, *Synoptic analysis, Water por, Precipitation (Atmospheric), Evapotrans-ration, Runoff, Infiltration, Meteorology, eather, Atmosphere, Atmospheric physics, Dis-bution patterns, Weather patterns.
entifiers: North America, Water vapor transport, ux divergence.

he atmospheric water vapor flux divergence is ed to investigate the water balance of parts of orth America for the period May 1, 1958 to Apr. , 1963. Data include mean monthly vertically in-grated distribution of flux divergence and ecipitable water, regional averages of runoff, and hyetal averages of precipitation. The atmospher-data extend up to a height of 300 mb. The flux vergence and precipitable water were used to timate the mean difference between precipitation d evapotranspiration. The total area of study is out 8.5 million km (3.3 million sq mi). The pat-rn of monthly evapotranspiration and storage mputed from atmospheric data becomes estionable in areas smaller than 200,000 sq mi. is is due to systematic error, to the inadequacy of porting, or the density of stations. The ornthwaite method systematically gives higher lues of the Summer evapotranspiration, lower lues for Winter, lower values for storage in Fall, d higher values for storage in Spring, than vapor ux methods. Only the 12-month harmonic is sig-ficant at the 95% level. Generative processes for rious types of data have been identified and coef-ients worked out for formulating the models for ese processes in particular cases. (Knapp-USGS)

A. Shiklomanov.
udy Gos Gidrol Inst, Issue No 163, p 126-148, 968. 23 p, 8 fig, 7 tab, 22 ref.

escriptors: *Floods, *Storm runoff, *Forest soils, Grasslands, *Electronics, *Mathematical models, ecipitation (Atmospheric), Hydrographs, reamflow, Hydraulic structures, High water ark, Slopes, Water loss, Infiltration, Evaporation.
entifiers: *USSR, Ukraine (European), Rain-orms.

n the basis of 4 gaging stations in the Ukraine, the drographs of rainstorm floods in small drainage eas were analyzed by using an electronic model-g apparatus. The analysis consisted of the calcu-ions of maximum discharges of percent frequen- using the Duhamel integral and experimental rmulas developed by I. A. Shiklomanov (1966), M. Kleen and R. Andrews (1962), Z. P. Bogomazova et al. (1948), D. L. Soklovskiy (1959), and others. The use of electronic modeling for the computation of floods of small unstudied streamflows is considered to be entirely reliable. (Gabriel-USGS)

RAINFALL-RUNOFF MODEL FOR SMALL BASIN FLOOD HYDROGRAPH SIMULATION,
Geological Survey, Menlo Park, Calif.
R. W. Lichty, D. R. Dawdy, and J. M. Bergmann.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Vol 2, Int Ass Sci Hydrol Publ No 81, p 356-367, 1968. 12 p, 6 fig, 2 tab, 10 ref.

Descriptors: *Model studies, *Rainfall-runoff relationships, *Flood forecasting, *Mathematical models, Systems analysis, Digital computers, Computer programs, Streamflow forecasting, Parametric hydrology, Hydrograph analysis, Infiltration, Surface-groundwater relationships, Simulation analysis, Optimization.
Identifiers: *Rainfall-runoff models.

A simplified, mathematical model of the surface-runoff component of streamflow response to storm rainfall was developed and programmed for digital-computer solution. The model uses an infiltration component based on an equation by Philip to determine rainfall excess, which is transformed by a linear basin-response function to simulate the flood hydrograph. An objective-fitting procedure that emphasizes the simulation of peak-discharge rate was used to identify optimum model parameters in a pilot study of a 5-sq mi drainage basin in North Carolina. Split-sample fitting and testing showed that predictive capability varied for 3 samples of flood events. Results of simulation for 2 test samples of pre-1948 flood events showed reasonable correspondence between simulated and observed flood peaks. The post-1948 test sample showed wide scatter between simulated and observed flood peaks. The post-1948 test sample showed wide scatter between simulated and observed flood peaks. Sensitivity analysis of objective-function response to parameter incrementation showed that antecedent moisture accounting grossly controlled the results of optimization. (Knapp-USGS)

GROUNDWATER-STREAMFLOW SYSTEMS IN WILSON CREEK EXPERIMENTAL WATERSHED, MANITOBA,
Manitoba Univ., Winnipeg. Dept. of Civil Engineering; and Manitoba Univ., Winnipeg. Dept. of Earth Sciences.
R. W. Newbury, J. A. Cherry, and R. A. Cox.
Can J Earth Sci, Vol 6, No 4, Part 1, p 613-623, Aug 1969. 11 p, 11 fig, 11 ref.

Descriptors: *Surface-groundwater relationships, *Streamflow, *Groundwater movement, *Water chemistry, Water quality, Hydrographs, Rainfall-runoff relationships, Infiltration, Runoff, Overland flow, Hydrologic budget, Base flow, Climates, Topography, Demonstration watersheds.
Identifiers: *Canada, *Manitoba, Wilson Creek Experimental watershed, Geochemical hydrographs.

Preliminary studies of the groundwater-streamflow systems in the Wilson Creek Watershed in southwestern Manitoba indicate that the hydrochemical characteristics of the system may be used to identify the base flow component of storm runoff hydrographs and to determine the proportions of the base flow derived from in-basin and out-of-basin recharge areas. Groundwater flow was studied by using a network of piezometers. Flow net analysis indicated local recharge and subsurface outflow from the basin. Base flow contributes sulfate, bicarbonate, and calcium to stream water. Streams, springs, and surface waters were analyzed and the results are shown by chemical hydrographs. (Knapp-USGS)

MANAGING CLIMATIC RESOURCES,
Rand Corp., Santa Monica, Calif.
J. O. Fletcher.

Prepared for publication in Impact, Jour of UNESCO. Rand Corporation, Publ P-4000-1, Mar 1969. 27 p, 3 fig, 18 ref.

Descriptors: *Thermal pollution, *Environmental effects, *Weather modification, *Computer simulation, *Atmospheric physics, Mathematical models, Weather data, Surface-water, Cloud cover, Heat exchange, Ocean circulation, Hydrologic cycle, Albedo, Carbon dioxide.
Identifiers: *Radiation balance, Ice extent, Global climate pattern, Satellite observation.

This report details the present knowledge and technology in observation, prediction and control of a human influence on the global climate by industrial heat discharge. Plans for both regional control of climatic variables and internationally cooperative projects are discussed for the future. Quantification of the global climate pattern involves data of ice extent, radiation variation, and atmospheric circulation. Variations of the patterns must be known (some meteorological history is given) before this data can be successfully used. Although it is concluded that the technological threshold from which progress can be proportional to the investment of effort has been reached, the following considerations are included: Current understanding of atmospheric and oceanic dynamics and heat exchange is too imperfect to predict the outcome of man's efforts to influence thermal forcing in atmospheric circulation. Although it would be theoretically more efficient to act directly on the moving atmosphere, engineering techniques for doing so are not presently available. The diversity of thermal processes that can be influenced in the atmosphere, and between the atmosphere and ocean, offers promise that, if global climate is adequately understood, it can be influenced for the purpose of either maximizing climatic resources or avoiding unwanted changes. (Sherman-Vanderbilt)

DISTRIBUTION OF HEAVY RAINFALL FREQUENCY AND ITS SEASONAL TRANSITION IN TOHOKU DISTRICT,
Tohoku Univ., Sendai (Japan). Faculty of Science.
Koya Hosokawa.
Sci Rep of Tohoku Univ, 7th Ser (Geogr), Vol 18, No 2, p 203-212, Mar 1969. 10 p, 4 fig, 6 ref.

Descriptors: *Rainfall intensity, *Frequency analysis, *Seasonal, Precipitation (Atmospheric), Water shortage, Flooding, Statistical methods, Typhoons, Topography, Summer, Winter, Spring, Climatology, Dynamics.
Identifiers: *Japan, Rainfall frequency.

Heavy rainfall frequency in the Tohoku district of Japan was investigated on the basis of field hydrologic mapping conducted by the author, and by earlier publications. The distribution of frequency varies with the season and can be subdivided into 4 distribution patterns, (February-June, July-August, September-November, and December-January). Seasonal transitions in the Tohoku district and Western Japan are a single microclimatic phenomenon. High frequency areas do not always coincide with the rainy areas, and in February the frequency of heavy snowfalls is high in the Pacific Ocean coastal area usually characterized by small snowfall. NORMAL ANNUAL PRECIPITATION IN THE WESTERN SIBERIAN PLAIN AND NORTHERN KAZAKHSTAN (RUSSIAN),
State Hydrological Inst., Leningrad (USSR).
G. A. Plitkin.
Trudy Gos Gidrol Inst, Issue No 163, p 91-103, 1968. 13 p, 1 fig, 2 tab, 26 ref.

Descriptors: *Precipitation (Atmospheric), *Water balance, Hydrologic data, Meteorological data, Mapping, Rain gages, Evaporation, Gaging stations, Mathematical studies, Statistical methods, Rivers, Watersheds (Basins), Heat balance, Winds.
Identifiers: *USSR, *Siberia (Western), Northern Kazakhstan.

This article describes briefly the earlier publications devoted to the distribution of annual precipitations in the western Siberian plain and northern Kazakhstan, and discusses the reliability of methods used for the evaluation of this distribution. After computing the corrected annual precipitation records in western Siberia and Karakhstan and comparing the water balance and heat balance techniques, the author draws the following conclusions: (1) the normal annual precipitation can be evaluated as the sum of a normal runoff and evaporation in the areas characterized by excessive humidity and paucity of hydrologic and meteorologic observations, with the sum of evaporation and runoff computed after M. I. Budyko's formula; and (2) the normal annual precipitation in the Yamalo-Nenets National district, computed by using the Budyko formula, gave reliable results. (Gabriel-USGS)

THE HYDROMETEROLOGICAL INTERPRETATION OF THE PRECIPITATION PATTERN,
Meteorologischer Dienst der Deutschen Demokratischen Republic, Berlin. Forschungsinstitut fuer Hydrometeorologie.
H. Schubert.
Symp on Geochem, Precipitation, Evaporation, Soil-Moisture, Hydrom, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 78, p 232-236, 1968. 5 p, 2 fig, 7 ref.

Descriptors: *Rainfall-runoff relationships, *Rainfall disposition, Networks, Rain gages, Distribution patterns, Isohyets, Hydrologic data, Water yield.
Identifiers: IHD, Rainfall microstructure.

The presentation of the precipitation pattern by meteorological criteria does not truly correspond to the hydrographic structure, this being the primary reason for the differences between the water budget developed from meteorological data and from balancing the water yield. Hence, a method was developed which restricts any subjective judgment of the data required for the preparation of the respective precipitation maps and permits a cartographic presentation of the optimum approximation of the precipitation pattern. A microstructure of the average precipitation pattern may be calculated from isohyetal maps, which is in reasonable agreement with the development of the hydrological network as well as with hydrological estimates by yield balance. (Knapp-USGS)

SYNTHESIS OF SEQUENCES OF SUMMER THUNDERSTORMS VOLUMES FOR THE ATTERBURY WATERSHED IN THE TUCSON AREA,
Arizona Univ., Tucson. Office of Hydrology and Water Resources.
A. Sariahmed, and C. C. Kisiel.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Vol 2, Int Ass Sci Hydrol, Publ No 81, p 439-447, 1968. 9 p, 2 fig, 5 tab, 12 ref. OWRR Proj A-010-ARIZ.

Descriptors: *Weather forecasting, * derstorms, *Arizona, *Mathematical m *Computer models, Digital computers, Simu analysis, Weather data, Flood forecasting, Ra runoff relationships, Operations research, Sy analysis, Synthetic hydrology, Depth-area-du analysis.
Identifiers: Tucson (Ariz).

An attempt is made to represent summer derstorm occurrences in the Tucson area some simple probabilistic principles and a computer. The purpose of the model is to fo many of the characteristics of the summer derstorms (storm duration, time between s storm depth, daily totals, etc). Such a simu model is intended as an input to a watershed for flood forecasting. Development of the m part of an operations research study of the hy gy and water resources of the Tucson basi synthetic data exhibits many of the characte of the historical sequences. However, the c tion between storm depth and storm dura weaker for the synthetic data than for its his counterpart. The model conserves the mea fall (seasonal, monthly, daily totals). (K USGS)

This paper is a survey of what is known abo weather and climate of the deserts of the wor an evaluation of research needs. Climatic bri presented for the major world deserts. The clude major references for climatic data a synoptic climatology. Desert storms and up circulations are each discussed. The conc aridity is considered in relation to theoretic empirical measurements of water use, oasis potential evapotranspiration, classification mate, indexes or aridity, and climatic a Other topics treated are weather modific microclimate, radiation, bibliographies and d tories. The lack of a satisfactory system for mining water need and water use, and f pressing aridity in those terms is emphasize empirical equations of Penman and Budyk suggested to be the most practical methods mating water need. If aridity and quantitativ mates of water need are to be defined and mined in terms of these equations, ord unavailable climatological data such as rad measurements, cloud cover and vapor pressu be required. More field studies are needed to mine the variations of climate that occur mirco- and meso-scale of distance. The level rent research and the authorities are discuss each desert region of the world. LTERING THE WATER BALANCE OF THE ASPIAN SEA BY REDUCING THE EVAPORA-ION AREA,
strakhan Hydrometeorological Observatory JSSR).
e. M. Kopaygorodskiy.
ceanology, Vol 7, No 1, p 91-93, 1967. 3 p, 2 fig. rans by Amer Geophysical Union from Oke-nologiya, Akad Nauk, SSSR, Vol 7, No 1.

escriptors: *Water balance, *Sea level, Evapora-on, Surface runoff, Precipitation (Atmospheric), roundwater movement, Dam construction, Sur-ce water, Groundwater.
lentifiers: USSR, *Caspian Sea, *Sea level sta-ilization.

he maintaining of a constant level of the Caspian ea is important for the national economy of the oviet Union. It was calculated that a 2-m fall in the :a level produced a 29,000 sq km reduction of the orth Caspian Sea. The water balance of the sea as used for calculation of the sea level stabiliza-on. The water balance requires the knowldege of ie following factors: surface runoff, groundwater ow, amount of precipitation on the sea, evapora-on from the sea surface, discharge into the Kara ogaz Gol, the fall in the sea level. The water alance equation was solved and it showed an an-ual deficit of 682 mm. Therefore, the Caspian Sea ould receive this amount annually in order to aintain a constant level. The dam construction nd other engineering structures were proposed to hange the hydrologic regime of the sea. (Carstea-SGS)

2E. Streamflow and Runoff

THE FLORENCE FLOODS,
Vermont Univ., Burlington. Dept. of Botany.
Richard M. Klein.
Natur Hist, Vol 78, No 7, p 46-54, Aug-Sept 1969. 1 fig, 4 photo.

Descriptors: *Floods, *Rainfall-runoff relationships, Streamflow, Discharge (Water), Disasters, Watershed management, Flood control, Flood protection, River training, Politcal aspects, Economics.
Identifiers: *Florence (Italy), Arno River.

The recent floods in Florence, Italy are not unique. The city has a long history of flood disasters caused by improper agricultural development of the Arno watershed in Tuscany, together with total law of flood control of the river. Of the 25-40 inches of rain every year in Tuscany, over 80% falls between October and January. The Tuscan hills have almost no vegetation except olives and grapes, no ground cover to retard runoff, and a nearly impervious soil surface. Since 1333 there has been a moderate flood every 24 years, a major flood every 26 years, and a disastrous flood every 100 years. The city's plan is ideal for intensifying flood damage, with its squares which fill rapidly and empty slowly, and a general layout that impedes runoff. No flood control, flood protection, or river training has ever been attempted. (Knapp-USGS)

FLOODS ON LICKING RIVER IN VICINITY OF SALYERSVILLE, KENTUCKY,
Geological Survey, Washington, D.C.
Curtis H. Hannum.
Geol Surv Hydrol Invest Atlas HA-329, 1 sheet, 1969. Text, 6 fig, 1 map, 2 photo, 1 tab, 2 ref.

Descriptors: *Floods, *Kentucky, *Stage-discharge relations, Discharge (Water), Streamflow, Surface waters, Hydrologic data, Flood control, Non-structural alternatives.
Identifiers: *Salyersville (Ky), Licking River.

A 1-sheet hydrologic atlas presents data that can be used to evaluate the extent, depth, and frequency of floods that affect the economic development of flood plains of the Licking River near Salyersville, Kentucky. The data provide a basis for solving existing flood plain problems and formulating regulations for land use and development that will reduce future flood damage. The report will be useful for preparing building and zoning regulations, locating waste disposal and water treatment facilities, and developing recreational areas. The flooded areas of 5, 25, and 50 year floods are shown on a 1:12,000 topographic map. Photographs, cross sections, profiles, text, and recurrence charts describe the flooding. (Knapp-USGS)

Identifiers: *USSR, River runoff.

Minimal runoffs of rivers in karstic areas were analyzed on the basis of hydrogeological and meteorological data recorded in the Onega-Severnaya Dvina, Silurian plateau, Northern Volga, and Cisuralian regions. The karstic areas are important factors affecting the minimal runoffs; the effects of karstic areas are determined by a degree of their karstification and hydrogeologic characteristics. The effect of karst is manifested by a decrease in small stream runoffs and by an increase in groundwater runoff. Mean minimal 30-day drainage of karstic rivers draining groundwaters is considerably higher, 2 to 4 times, than that shown by zonal values. Karstic rivers draining groundwater reservoirs are characterized by consistency in maintaining their minimal runoffs. The evaluation of minimal runoff in karstic areas is difficult because the runoff is affected by several conditions which are difficult to evaluate. (Gabriel-USGS)

Descriptors: *Runoff, *Rivers, *Discharge (Water), Mining, Water utilization, Gaging stations, Hydrogeology, Geologic mapping, Winter, Summer, Watersheds (Basins), Aquifers, Floods, High water mark, Water sources, Hydrographs, Precipitation (Atmospheric), Fissures (Geology), Winds.
Identifiers: *USSR, Amur River, Lena River, Yenisey River.

Minimal runoffs in the upper reaches of the Yenisey, Lena, and Amur River basins were analyzed on the basis of hydrogeological and meteorological data recorded during the 1959-1965 period. Using maps of distribution of minimal 30-day and annual water discharges and the tables of basic parameters of minimal runoffs, the Transbaikal region can be subdivided into 6 districts characterized by their distributions of annual precipitation and river discharges. MEAN LONG-TERM WATER BALANCE OF MOUNTAIN WATERSHEDS BASED ON THE DATA OF TRANSCARPATHIAN GAGING STATIONS (RUSSIAN),
State Hydrological Inst., Leningrad (USSR).
M. I. Kirilyuk.
Trudy Gos Gidrol Inst, Issue No 163, p 55-90, 1968. 36 p, 3 fig, 12 tab, 25 ref.

Descriptors: *Water balance, *Watersheds (Basins), *Discharge (Water), *Gaging stations, Agricultural watersheds, Streamflow, Geologic control, Soils, Forests, Precipitation (Atmospheric), Climates, Evaporation, Mathematical studies, Aquifers, Snow.
Identifiers: *USSR, Transcarpathian river basins.

An analysis is made of the effect of various basic parameters on the long-term water balance of the Rika River basin of Transcarpathia. Data recorded at 441 to 1431 m altitudes in 1947 to 1966 show that the monthly and annual precipitations are a function of altitude of the watersheds. The evaporation values for the basin were evaluated by using an equation of heat balance based on the actinometric observations recorded at the Mezhgor'ye gaging station. Changes in the supply of moisture in the snow cover, soils, and groundwater reservoirs were analyzed by using the corresponding data. Precipitation and runoff increase and the evaporation does not change with the watershed altitude. (Gabriel-USGS)

Trudy Gos Gidrol Inst, Issue No 156, 1968. 178 p, 33 fig, 45 tab, 133 ref.

Descriptors: *Sediments, *Runoff, *Mathematical studies, *Methodology, Streamflow, Turbulent flow, Rivers, Kinetics, Suspended load, Photography, Physical properties, Geographical regions, River basins, Irrigated land, Waves (Water), Wind velocity.
Identifiers: *USSR, Regime theory, Sedimentation theory and measurement, Water runoff theory and measurement.

This book is a collection of 12 investigations on the regime, theory, and calculation and measurement of sediments and water runoff based on analytical and experimental studies using the data recorded in the USSR. The following articles describe the studies: (1) Kinetics of turbulent river flow and the effect of sediments; (2) Some experience in the theoretical study of suspended load discharge of flat area rivers; (3) Results of field investigations and the calculation of runoff-entailed sediments of the Mzymty River; (4) Photographic method of granulometric analysis of course sediments; (5) Determination of the mean long-term annual discharge of sediments by taking physico-geographical conditions into consideration; (6) Study of discharge sediments of the Polomet River basin; (7) Sediment discharges of the rivers of the maritime province; (8) Determination of the norms and cyclic oscillations of the discharge of suspended load; (9) Field investigations of the sediments of irrigated lands; (10) The basis of turbidity formulas in evaluating wave spectra; (11) Principles of wind current modeling and the formation of pollution in water reservoirs; and (12) Natural study of dilution of river runoff and verification of calculating methods. DETERMINATION OF MIXING LENGTHS IN DILUTION GAUGING,
Water Research Association, Medmenham (England).
A. Barsby.
Symp on Geochem, Precipitation, Evaporation, Soil-Moisture, Hydrom, Proc Gen Assembly of Bern (Sept-Oct 1967), Int Ass Sci Hydrol, Pub No 78, p 395-407, 1968. 13 p, 6 fig, 8 ref.

Descriptors: *Tracers, *Tracking techniques, *Discharge measurement, *Mixing, Diffusion, Dispersion, Dye releases, Discharge (Water), Streamflow, Stream gages, Streamflow forecasting.
Identifiers: Dilution gaging (Streamflow), England.

Dilution gaging of river discharge depends on the injected tracer becoming adequately mixed with the flow before sampling. However, as dispersion along a needlessly great mixing length is wasteful of time and tracer, it is important to determine the minimum length of mixing, by calculation from channel and flow parameters or observation of the dispersion of a preliminary injection. Constant rate injections were used in a series of 9 tests of discharges ranging from 0.05 to 5 cu m/sec. At several stations along each stream, mixing was observed by measuring the variation in concentration from bank to bank. By using logarithmic interpolation of observed mixing at each station, deduced lengths for 99% mixing were compared with results given by empirical formulae. The most satisfactory of these was Rimmar's, and a modification of his formula is suggested, permitting evaluation of mixing lengths from easily measured parameters. Sayre's equation for lateral dispersion in a finite channel was developed to provide a simple technique of extrapolating from a partial mixing length to the 99% mixing length. Accordingly, preliminary injection experiments can be conducted over a small fraction of the eventual mixing length. Generally, calculations from channel parameters seems preferable in small turbulent streams, where a conservative estimate would be tolerable; the preliminary injection method is recommended for larger rivers where accuracy of prediction justifies the additional work involved. Identifiers: *France, Rhone River, Rhine River, plicit methods, Implicit methods.

Mathematical models are coming into increa use as a means of investigating unsteady river channel flow. Their potential scope is br described. The Saint-Venant equations gradually varying unsteady flow constitute a hy bolic quasilinear system. The can be integrate 2 basic numerical methods: explicit methods implicit methods. Each problem is represented hydraulic scheme allowing for the various rami tions and featuring all the weirs, flow inputs, c sectional changes, diversions and other sp points in the system. One or 2 conditions (hy graph or level chart) will be given upstream f each branch, and a stage-discharge relationshi a level record downstream from the model, als operating relationship for each singular point. initial conditions also require defining. They ca calculated for steady flow, but if the phenom is already developing at the point at which the culation starts, they have to be assumed; they usually of little importance, however, as the fects are no longer felt after a certain time. E ples of flood-routing studies mentioned are a s of the Rhine at Karlsruhe and of the Rhone a

ns. The Rhine's hydraulic scheme features a
ıber of hydro-power plants and that of the
ne several weirs. (Knapp-USGS)

Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Vol 2, Int Ass Sci Hydrol, Publ No 81, p 569-583, 1968. 15 p, 11 fig, 1 tab, 2 ref.

Descriptors: *Floods, *Recession curves, *Computer programs, Flood plains, Flood forecasting, Streamflow forecasting, Stage-discharge relations, Routing, Hydrographs, Hydrograph analysis.
Identifiers: Forchheimers formula, Flood waves.

By applying Forchheimer's formula for flood wave crest subsidence in a discharge profile with partly or entirely inundated flood plains, a relation was developed between the subsidence of a unit runoff in a unit profile and the subsidence of a variable runoff in the profile considered. Numerical values of a 'subsidence function' were derived from a computer calculation. Observations of an actual situation fit reasonably the theoretical scheme. (Knapp-USGS)

Identifiers: *Irreversible thermodynamics.

Experimental data obtained on a liquid saturated sample of sodium kaolinite consolidated under 408 kg/sq cm, show that the simultaneous fluxes of liquid and charge under hydraulic, electrical, and electrolyte concentration gradients obey the macroscopic rate laws derived from the irreversible thermodynamics of discontinuous systems, except that the experimental flux versus driving force relations possess hydraulic and electrical potential intercepts. It is proposed that the intercepts arise from electrolyte concentration gradients within the sample, generated by differential salt filtering at the sample surfaces during consolidation increments. This mechanism is suggested by nonsymmetrical details in the mechanical system used to consolidate the sample, and it provides an explanation for the intercepts which is not inconsistent with the fundamental postulates of irreversible thermodynamics. GROUND-WATER RESOURCES OF JOHNSON COUNTY, TEXAS,
Geological Survey, Austin, Tex.
Gerald L. Thompson.
Tex Water Develop Board Rep No 94, Apr 1969. 84 p, 17 fig, 8 tab, 38 ref.

Descriptors: *Water resources, *Groundwater, *Texas, Water wells, Water yield, Water quality, Aquifers, Water utilization, Hydrologic data, Data collections, Water levels, Water-level fluctuations.
Identifiers: *Johnson County (Tex).

About 3.2 mgd or 3,600 acre-ft annually, of groundwater was used in Johnson County Texas in 1966 for public supply (1.2 mgd), rural domestic (0.98 mgd), livestock (0.89 mgd), and industrial (0.17 mgd) needs. Part of the water for public supply and industrial uses in the central part of the county is surface water obtained from recently constructed reservoirs. The principal water-bearing formations in the county and the approximate quantity of water supplied in 1966 are, as follows: Hosston Formation, 580 acre-ft; Travis Peak Formation, 360 acre-ft; Paluxy Sand, 2,000 acre-ft; Woodbine Formation, 680 acre-ft; and a small quantity from the Quaternary alluvial deposits. About half of the water now being withdrawn from the Paluxy comes from storage; the Paluxy transmits about 1,000 acre-ft per yr (about 1 mgd) less than the quantity currently being pumped in the county. In 1966, pumpage from the Woodbine was less than half of the amount transmitted. Also, there is available from storage in the Woodbine in the eastern part of the county, about 2,100,000 acre-ft of water. (Knapp-USGS)

Israel J Earth-Sci, Vol 18, No 1, p 29-32, 1969. 4 p, 5 fig, 9 ref.

Descriptors: *Karst, *Thermal water, Mineralogy, Groundwater movement, Solutes, Aqueous solution, Solubility, Thermal springs, Carbonate rocks, Water chemistry, Manganese.
Identifiers: *Israel, Negev.

Caves formed by solution processes are reported from the central Negev. The caves were assumed to have formed by karst-forming processes involving dissolution of rocks by meteoric water circulation. Further studies of this phenomenon revealed mineralization phenomena which make it difficult to attribute to the caves a normal karstic genesis and which indicate a process involving ascending mineralized water. GROUND-WATER FLOW SYSTEMS AND THE ORIGIN OF EVAPORITE DEPOSITS,
Idaho Bureau of Mines and Geology, Moscow.
Roy E. Williams.
Idaho Bur Mines and Geol Pam No 141, Aug 1968. 15 p, 3 fig, 39 ref.

Descriptors: *Water chemistry, *Groundwater, *Saline water systems, Aqueous solutions, Groundwater movement, Porosity, Permeability, Solubility, Leaching, Solutes.
Identifiers: *Evaporites.

Study of the literature on evaporite mineral deposits suggests a functional relationship between the origin of these deposits and ground water flow systems. The theory on which the analysis of groundwater flow systems is based is reviewed in order to establish flow systems as a mechanism by which dissolved solids can be transported to sites of evaporite mineral accumulation. Comparison of observed spatial variations of groundwater quality with pertinent solutions to flow equations under specified boundary conditions reveals that quality of groundwater is a function of flow path length, flow path route and flow velocity. Selected references provide evidence that sites of accumulation of non-marine evaporite minerals are discharge zones for poor quality water from regional groundwater flow systems. A study of isotope rations in oil field brines and standard mean ocean water indicates that water in some deep brines is of local meteoric origin; therefore, the brines are part of a groundwater flow system. Observed distribution of fluid potential in the saline portion of some groundwater flow systems on the Atlantic Coast of the United States reveals that saline groundwater discharges toward the ocean floor. Therefore, groundwater may also act as a transport medium for dissolved solids which are precipitated, under appropriate conditions, as marine evaporite deposits. (Knapp-USGS)

EXPERIENCES GAINED WITH DIGITAL COMPUTERS IN ANALYZING THE DISCHARGE AND THE RADIUS OF INFLUENCE OF WELLS IN POROUS AQUIFERS,
Design Bureau for Hydraulic Planning, Budapest (Hungary).
S. Leczfalvy.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Vol 2, Int Ass Sci Hydrol Publ No 81, p 368-377, 1968. 10 p, 7 fig, 2 tab.

Descriptors: *Mathematical models, *Groundwater movement, *Digital computers, Steady flow, Unsteady flow, Water table, Discharge (Water), Aquifers, Drawdown, Drainage systems, Recharge, Infiltration, Seepage.
Identifiers: Hungary.

The relations of discharge and radius of influence to infiltration rates, hydraulic gradient, and regional water table in constant-drawdown wells and mine drains are studied. The derivation of descriptive formulae was aided by computers. Analysis of data showed that the radius of influence was greatly diminished with higher infiltration rates without increase of discharge. The greatest influence on discharge is exerted by permeability. Solutions of seepage and groundwater movement problems are presented for horizontal and tilted water tables replenished by precipitation, with both steady and non-steady flow. (Knapp-USGS)

Identifiers: *Hele-Shaw models.

Analytic techniques were developed and applied to the study of the flow pattern in a two-dimensional steady state, homogeneous isotropic groundwater basin. The geometry of the zones of recharge and discharge is a function of ground-surface profile, variation in rate of recharge, hydraulic conductivity of porous media, and the geometry of the flow domain. Two independent methods of solution, using least square and Fourier expansion, were developed to solve the Laplace equation for single-layered and multi-layered systems; the results were checked with laboratory experiments using the Hele-Shaw model. A mathematic model was formulated to accurately describe the flow pattern in a two-dimensional steady state groundwater basin. (Knapp-USGS)

THE IMPACT OF THE DEEP TUNNEL PLAN ON THE WATER RESOURCES OF NORTHEAST ILLINOIS.
Harza Engineering Co., Chicago, Ill.; and Bauer Engineering, Inc., Chicago, Ill.

Harza Eng Co and Bauer Eng, Inc Rep to Chicago Metrop Sanit Dist, Feb 1969. 20 p, 6 fig, 1 append.

Descriptors: *Water pollution control, *Storm runoff, *Tunnels, *Water storage, *Hydrologic aspects, Storm drains, Pumped storage, Retention, Groundwater, Aquifers, Illinois, Cities, Urbanization.
Identifiers: *Chicago deep tunnel plan, Combined sewers.

The possible effects of the proposed Chicago deep tunnel urban runoff retention scheme on the water resources of northeastern Illinois were estimated by surveying the hydrogeology, surface water hydrology, and groundwater development of the area. Chicago has a combined sewer system, and storm runoff overloads cause discharge of raw sewage to waterways including recreational areas of Lake Michigan. A system of deep tunnels and protective recharge wells is proposed for temporary storage of peak combined loads. The system is expected to release treated storm runoff at a steady rate, greatly regulating the streamflow of receiving streams. High groundwater heads must be maintained to prevent loss of contaminated water from the tunnels, requiring good groundwater management practices for the entire area. (Knapp-USGS)

NUMERICAL SOLUTIONS OF THE NAVIER STOKES EQUATION FOR FLOW THROUGH IDEALIZED POROUS MATERIALS,
University Coll. of Townsville (Australia). Dept. of Engineering.
K. P. Stark.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Vol 2, Int Ass Sci Hydrol, Publ No 81, p 635-649, 1968. 15 p, 16 fig, 3 tab, 27 ref.

Descriptors: *Groundwater movement, *Mathematical studies, *Digital computers, Approximation method, Numerical analysis, Flow, Porous media, Equations.
Identifiers: Navier-Stokes equations, Heration methods.

Solutions of the Navier-Stokes equations for flow in porous media are possible with high-speed digital computers. The solutions can give detailed information about flow characteristics, and compare well with experimental results. Numerical methods discussed include linearization, finite difference techniques, boundary condition selection, and the use of limiting equations such as Darcy's. (Knapp-USGS)

GROUNDWATER PROBLEMS,
Swedish Natural Science Research Council, Stockholm.
E. Eriksson, Y. Gustafsson, and K. Nilsson.
Proc Int Symp on Groundwater Problems, Oct 1966, Stockholm, Sweden, Wenner-Gren Symp Ser, Vol 11, 1968. 223 p.

Descriptors: *Water resources, *Groundwater, *International hydrological decade, *Conferences, Groundwater movement, Hydrogeology, Aquifers, Water chemistry, Water quality, Water level fluctuations, Tracers, Water pollution, Artificial recharge, Water storage, Water yield.
Identifiers: *Sweden, Groundwater development, Symposium.

Groundwater problems in Sweden are discussed in a 12-paper IHD symposium held in 1966. In Sweden over half of all domestic water is developed from groundwater, and the amount is increasing. Groundwater depletion, land subsidence, and groundwater contamination exist and may become more serious. The symposium includes the general topics of groundwater movement, groundwater storage, water availability, water-level fluctuations, hydrogeology, groundwater chemistry, tracer studies, water quality protection, and artificial recharge. GROUNDWATER IN PRECAMBRIAN ROCKS IN SOUTHERN SWEDEN,
Lund Univ. (Sweden). Dept. of Physical Geography.
Ingemar Larsson.
Proc Int Symp on Groundwater Problems, Oct 1966, Stockholm, Sweden, Wenner-Gren Symp Ser, Vol 11, p 23-41, 1968. 19 p, 21 fig, 16 ref.

Descriptors: *Groundwater, *Fractures (Geology), *Hydrogeology, Faults (Geology), Groundwater movement, Permeability, Porosity, Structural geology, Geologic control.
Identifiers: *Sweden.

Groundwater in Precambrian gneisses and granites in southern Sweden only in faults and joints in the rock. By fabric analysis it is possible to separate two main groups of these fractures: the local pattern, syntectonic to the fold axis, and the grain fabric and the post-crystalline pattern. Within certain limits the latter may be generalized to a tectonic model. The faults and joints of the local pattern produce a very low yield of groundwater. It is shown in the paper how some of the faults and joints of the postcrystalline pattern may give a high yield of groundwater, and their relation to the tectonic model is discussed. (See also W69-09282). (Knapp-USGS)

TRACERS FOR GROUNDWATER INVESTIGATIONS,
Chalmers Univ. of Technology, Goteborg (Sweden). Inst. of Geology.
Gert Knutsson.
Proc Int Symp on Groundwater Problems, Oct 1966, Stockholm, Sweden, Wenner-Gren Symp Ser, Vol 11, p 123-152, 1968. 30 p, 10 fig, 1 tab, 98 ref.

Descriptors: *Tracers, *Tracking techniques, *Groundwater movement, Aquifers, Radioisotopes, Salts, Ions, Electrolytes, Dye releases, Hydrogeology, Karst, Sands, Gravels.
Identifiers: Complex ion tracers.

Tracers have been used in Sweden since 1869 to establish hydraulic connections in the ground and to determine the velocity of groundwater flow. Some organic dyes, Sulforhodamine G Extra, Rhodamine WT and under certain pH conditions also Uranine, seem to be useful as tracers for investigating groundwater flow in fractures and channels. Cation tracers are mostly adsorbed in porous media. Tracers for studying groundwater flow must be chosen from among anions and metal complexes. Thanks to the rapid development of analytical methods (atomic absorption, emission spectrography and neutron activation analysis) it is possible today to perform tracer tests using low concentrations of anions and complexes. Selective and precise measurement of low concentration of the radioisotopes can usually be carried out directly in the field. Tritiated water is a good tracer as it behaves essentially the same as normal water. But tritium is not easily detected in the field because of its very soft beta radiation. Among anions, iodide ion (NaI or KI containing I-131 and bromide ion containing Br-82) seem to be the most reliable. A disadvantage is that their half-lives are too short for most groundwater tests. Two very stable metal complexes are cobalt-cyanide containing Co-60 or Co-58 and Cr-51 EDTA complex have more suitable half-lives and have been successfully applied in many field investigations. Stable isotopes and natural radioisotopes are of great importance to obtain a general survey of the regional groundwater conditions, to determine the geographical origin, the age of water and in studying the water balance. (See also W69-09282). (Knapp-USGS)

STRUCTURE, STRATIGRAPHY, AND HYDROGEOLOGY OF THE NORTHERN ROSWELL ARTESIAN BASIN, CHAVES COUNTY, NEW MEXICO,
Kay C. Havenor.
N Mex Bur Mines and Mineral Resources, Inst of Mining and Technol Circ No 93, 1968. 30 p, 2 fig, 6 tab, 23 ref, 2 append.

Descriptors: *Hydrogeology, *Aquifers, *Artesian wells, *New Mexico, Porosity, Saline water intrusion, Water yield, Geology, Structural geology, Faults (Geology), Geologic control, Karst.
Identifiers: *Roswell Artesian Basin (N Mex).

Structural and stratigraphic controls of the quantity and quality of waters within the northernmost part of the Roswell artesian basin were studied using outcrops, cores, samples, and electric logs. Three structural blocks named Six Mile, Roswell, and Orchard Park, are delineated. The artesian aquifer is developed in the top 1.3 of the San Andres upperunit and in the overlying Grayburg. The Queen forms the aquitard between the artesian and shallow aquifer of the Seven Rivers Formation and the overlying Tertiary - Quarternary alluvium. Structural uplift and consequent deep, irregular erosion have stripped the Artesia Group and the upper unit of the San Andres from the Roswell block. Secondary porosity enlargement has been developed in the Slaughter zone of the artesian aquifer. Reduced heads, because of regional over-appropriation, and reduced pressure, caused by locally intensive pumping on the Roswell block, relieve the retarding hydrostatic pressure on the saline waters in the regionally porous Slaughter zone and permit saline water encroachment into the Roswell block. (Knapp-USGS)
W69-09290

SUBSIDENCE IN MEXICO CITY IN RELATION TO GROUNDWATER OVERDRAFT,
Office of Hydraulic Resources (Mexico).
Ignacio Sainz Ortiz.
Hydrol of Fractured Rocks Vol 2, Proc Dubrovnik Symp (Oct 1965), Int Ass Sci Hydrol, Pub 74, p 665-671, 1967. 7 p, 6 fig.

Descriptors: *Mexico, *Subsidence, *Overdraft, *Groundwater, *Water resources, Topography, Economics, Population, Water storage, Water requirements, Water wells, Geology, Porosity, Pressure, Aquifers, Pumping, Water recharge.
Identifiers: Mexico City.

The author illustrates and briefly discusses the hydrologic, geologic, and hydraulic conditions which exist in the aquifers of the Mexico City area and suggests some methods for decreasing the process of subsidence. Several charts, cross sections, and curves are used to summarize the pumping and borehole data and to show that surface-water resources in the watershed are very limited and the storage and regulation facilities are scarce and expensive. The aquifers are confined by extensive layers of volcanic tuff in the hills and by thick layers of highly compressible volcanic clays in the plains; 1250 deep wells drawing 11.7 cu m/sec from groundwater sources are located in the city area and are the cause of a very serious overdraft. Subsidence over the plain of the Valley of Mexico is uneven and its intensity is a function of pore pressure and of the thickness and mechanical properties of the clay formations. (Gabriel-USGS)

LOCAL AND REGIONAL MINERALIZATION OF KARST GROUNDWATERS AND THEIR VARIATIONS IN THE DEVONIAN LIMESTONES OF THE RHINE SCHISTOSE MOUNTAINS,
Technische Hochschule, Aachen (West Germany).
H. R. Langguth.
Hydrol of Fractured Rocks Vol 2, Proc Dubrovnik Symp (Oct 1965), Int Ass Sci Hydrol, Pub 74, p 672-683, 1967. 12 p, 8 fig, 1 tab.

Descriptors: *Groundwater, *Water chemistry, *Karst, *Limestones, Water analysis, Shales, Geohydrologic units, Biological properties, Magnesium, Calcium, Hydrologic properties, Springs, Alkaline water, Hardness (Water), Carbon dioxide, Tertiary period.
Identifiers: *Western Germany, Rhine river area, Schistose mountains.

Mineralization of karst aquifers located in the Devonian limestones of Western Germany is described on the basis of geological and geochemical data. The limestones are subdivided by faults into isolated segments of relatively small catchment areas. The analysis of groundwaters present in these segments indicates that their chemical composition depends on the geological conditions and biological activities present in these geological blocks, with a regional decrease in mineralization toward the west. Under a complete cover of Tertiary rocks, the groundwaters are of variable character showing cation-exchange and reduction of some anions in passing through glauconitic layers. (Gabriel-USGS)

LATERAL MOVEMENT OF WATER THROUGH THE UNSATURATED ZONE OF AN UNCONFINED AQUIFER,
California Univ., Berkeley. Hydraulic Lab.
Fereidoun Mobasheri, M. Shahbazi, and D. K. Todd.
Calif Univ Water Resources Center Contrib No 106, Nov 1965. 39 p, 10 fig, 3 tab, 12 ref, 2 append.

Descriptors: *Unsaturated flow, *Aquifers, *Groundwater movement, *Model studies, *Hydraulic models, Permeability, Water table, Analytical techniques, Interfaces, Hydraulic conductivity, Moisture tension.
Identifiers: Lateral unsaturated flow.

Unsaturated lateral flow in unconfined aquifers was studied by mathematical analysis, sand-box, and sand-column model studies. The hydraulic conductivity decreased as the negative pressure of the porous media increased. The calculated equivalent depth of the unsaturated zone for the sand used in the investigation was 35 cm. The flow rate through unsaturated zone increased with a decreasing rate as the unsaturated zone depth increased while the hydraulic gradient was kept constant. The rate of lateral flow movement could also be calculated to a reasonable accuracy from flow net diagrams or the graphical integration of the area under a characteristic conductivity curve. An example of the application of the results can be shown by the determination of underflow at Cedar Springs Damsite in Southern California where flow through unsaturated zone was neglected although the average depth of the aquifer was only 12 ft. The material is predominantly medium-grained sand with lenses of gravel and cobbles. As the average depth of the aquifer is 12 ft, the lateral flow through the unsaturated zone could amount to 11% of the total lateral flow. (Knapp-USGS)

2G. Water in Soils

SOIL WATER MOVEMENT AS AFFECTED BY DEEP FREEZING,
Forest Service (USDA), St. Paul, Minn. North Central Forest Experiment Station.
Richard S. Sartz.
Soil Sci Soc Amer Proc, Vol 33, No 3, p 333-337 May-June 1969. 5 p, 6 fig, 16 ref.

Descriptors: *Soil water movement, *Frozen soils, *Freezing, *Infiltration, Frost action, Frost, Permeability, Frozen ground, Diffusion, Percolation, Porosity, Unsaturated flow.
Identifiers: Frozen-soil permeability.

Knowledge of water movement into and through frozen soils is needed for studying the hydrologic behavior of northern watersheds. Soil water was logged by the neutron method in both sandy and silty soils over 4 winters in southwestern Wisconsin. Bonded frost depth, which ranged from 8 to 12 cm at maximum penetration, was measured concurrently by frost probe or resistance blocks. Changes in soil water took place throughout much of the frost season, even with deep soil frost. One series of data showed that water may infiltrate and percolate through more than 60 cm of hard-frozen ground. However, frozen ground did impede percolation, causing a buildup of water in the frozen zone during spring melt. Although neutron readings increased at upper levels during the frost season, most of the increases could not be accounted for by decreases at lower levels. Thus, the appeared to result more from infiltration than from upward migration as reported by others. (Knapp-USGS)
W69-09139

ADSORPTION OF NONIONIC SURFACTANTS BY SOIL MATERIALS,
California Univ., Riverside. Dept. of Soils and Plant Nutrition.
N. Valoras, J. Letey, and J. F. Osborn.
Soil Sci Soc Amer Proc, Vol 33, No 3, p 345-348 May-June 1969. 4 p, 7 fig, 1 tab, 9 ref. Grant No 4000 (Forest Service, USDA).

Descriptors: *Adsorption, *Surfactants, *Soils, Wettability, Clays, Solubility, Wetting, Peat, Organic matter, Infiltration, Water chemistry, Water properties.
Identifiers: Micelles, Soil wettability, Water repellent soils.

The adsorption of nonionic surfactants by various soil materials from solution was measured. Most studies were on Aqua Gro and Soil Penetrant--surfactants marketed for use on soils. Aqua Gro was generally adsorbed to a greater extent than Soil Penetrant. Essentially all of Aqua Gro was adsorbed from solution until a given amount of surfactant was adsorbed after which there was only a slight increase in adsorption as the concentration in solution increased. Soil penetrant, on the other hand, was adsorbed to a lesser extent until the concentration in solution was increased to about 50 ppm. At this concentration, there was a very great increase in adsorption to a maximum value after which very little additional adsorption occurred as the solution concentration increased. Equilibrium between the soil and solution was either complete or near completion after one hour. Essentially no Aqua Gro was desorbed as the treated soil was placed in water. Some of the adsorbed Soil Penetrant went into solution as treated soil was placed in water. Since the reaction between soil and surfactant differs for various surfactants, the surfactant which would have optimum properties for a desired effect can be chosen. (Knapp-USGS)

N SITU DETERMINATION OF PHYSICAL ROPERTIES OF THE SURFACE LAYER OF IELD SOILS,
ritish Columbia Univ., Vancouver.
De Vries.
oil Sci Soc Amer Proc, Vol 33, No 3, p 349-353, lay-June 1969. 5 p, 9 fig, 3 tab, 5 ref. Grant No A 556 NRC (Canada).

escriptors: *Soil moisture, *Moisture tension, Tensiometers, *Nuclear moisture meters, Calibraons, Soil moisture meters, Soil physical properes, Moisture content, Water yield, Soil water ovement, Laboratory tests, On-site tests.
lentifiers: *Soil surface layer, Water retention urve, Water retention.

set of gamma ray attenuation vs. soil water atric potential data was obtained in situ by satuting an undisturbed block of soil, and by lowering e water level in steps and measuring the count te through the soil and the corresponding water atric potential at each step. Relative water conents were calculated from the count rates by use of rational calibration equation. The corresponding atric potential was measured with a low imedance tensionmeter. A partial water retention urve was plotted from these data, from which in rn the air intrusion value and the aeration porosi were inferred. It was shown that collimation is ssential for measurements within the 1-cm thick rface layer, but it is not required for measureents within the bulk of a layered system. With a 5-c cesium-137 source, a collimated beam and a 4-in counting time, the precision was 0.6% water ontent due only to errors associated with random mission. There was good agreement between a artial water retention curve obtained in situ and e one obtained with an outflow method in the aboratory. (Knapp-USGS)
W69-09142

IACROSCOPIC SWELLING AND HYDRAULIC CONDUCTIVITY PROPERTIES OF FOUR VERMICULITIC SOILS,
Agricultural Research Service, Riverside, Calif. alinity Lab.
. D. Rhoades, and R. D. Ingvalson.
oil Sci Soc Amer Proc, Vol 33, No 3, p 364-369, lay-June 1969. 6 p, 2 fig, 5 tab, 25 ref.

Descriptors: *Hydraulic conductivity, *Expansive oils, Expansive clays, Soil water movement, Electrolytes, Ion transport, Permeability, Clays, Clay minerals, Mineralogy.
Identifiers: Vermiculitic soils.

The extent to which mixed Na, Ca electrolyte solutions affected the hydraulic conductivity and macroscopic swelling properties of 4 vermiculite soils was determined. Macroscopic swelling did not occur in the under 5 micron fraction of the soils until exchangeable-sodium-percentage (ESP) values in excess of 30 to 60 and electrolyte concentrations of less than 20 meq/liter were established. Decreases in hydraulic conductivities (HC) of soils devoid of montmorillonite did not occur at ESP values less than 50 in the absence of mechanical and chemical disaggregation. After disaggregation, decreases in HC occurred in the ESP range of 10-30 at electrolyte concentrations of 5-10 meq/liter. The concept of 'inactive exchangeable Na' residing in non-clay-sized vermiculite particles is introduced. (Knapp-USGS)

APPRAISAL OF RESEARCH ON SURFACE MATERIALS OF DESERT ENVIRONMENTS,
Arizona Univ., Tucson; and Army Natick Labs., Mass.
Harold E. Dregne.
In W. G. McGinnies, B. J. Goldman, and Patricia Paylore, eds., Deserts of the World, an Appraisal of Research into their Physical and Biological Environments, p 285-377, University of Arizona Press, Tucson, 1968. 93 p, 2 tab, 481 ref.

Descriptors: *Deserts, *Synoptic analysis, Arid lands, Climates, Aeolian soils, Dunes, Soil types, Soil texture, Soil surveys, Soil physical properties, Soil moisture, Soil groups, Soil classifications, Saline soils, Soil tests, Soil analysis, Calcareous soils, Sands, Winds, Moisture availability, Soil stability, Irrigation effects, Trafficability, Soil chemical properties, Soil compaction, Soil contamination effects, Soil engineering, Soil formation, Soil surfaces, Microorganisms, Fungi, Azotobacter, Algae, Soil moisture movement, Evapotranspiration, Saline soils, Sodium, Nitrogen, Organic matter, Bibliography, Hydrogen ion concentration.
Identifiers: Atacama-Peruvian Desert, North American Desert, Termites, Hardpans, Desert pavement, Piping, Kalahari-Namib Desert, Sahara Desert, Somali-Chalbi Desert, Arabian Desert, Iranian Desert, Thar Desert, Turkestan Desert, Takla-Makan Desert, Gobi Desert, Australian Deserts, Monte-Patagonian Desert.

This paper is a survey of the state of knowledge of surface materials in the major desert regions of the world. Existing problems are emphasized and recommendations for future research are made. A resume of principal soils of each desert is presented along with a review of the pertinent literature. Tables list soil authorities and depositories of soils information, both geographically. A variety of aspects of the biological, chemical and physical properties of soils in arid and semiarid regions are discussed. Russian, French, Dutch and U.S. systems of soil classification are compared and the complications resulting from the use of multiple systems is pointed out. The duplication in classification by agricultural soil scientist and soil engineers is examined and suggestions for a unified soil nomenclature system are presented. Data is still very sparce for arid and extremely arid areas, most soils studies resulting from agricultural interests. Development of soils under arid conditions is poorly understood. Confusion in terms, such as color and group names, used to classify arid-zone soils, is a major deficiency. Soil-water ratio dilutions for pH and soluable salts are frequently not indicated in the literature, making reliable comparisons impossible. Improved methods are needed for determining soil texture, soil aggregation, exchangeable calcium and magnesium in calcareous soils, and exchangeable sodium in highly saline soils. Studies are needed in trafficability. (See W69-09206). (Sherbrooke-Ariz)

NUMERICAL ANALYSIS OF PONDED RAINFALL INFILTRATION,
Geological Survey, Menlo Park, Calif. Water Resources Div.
J. Rubin.
Proc Wageningen Symp on Water in the Unsaturated Zone, Int Ass Sci Hydrol Pub No 82, p 440-451, 1969. 12 p, 5 fig, 8 ref.

Descriptors: *Infiltration, *Unsaturated flow, *Soil water movement, Surface-groundwater relationships, Soil moisture, Rainfall intensity, Mathematical models, Digital computers, Permeability, Porosity, Particle size, Hydraulic gradient, Water spreading, Flooding.
Identifiers: *Ponded infiltration.

The preponding and ponded stages of rainfall infiltration were studied by solving numerically the partial differential equation of downward moisture flow in unsaturated soils. To make such a study possible, the previously developed numerical method for rain infiltration analysis was appropriately modified. The modified method was used for computing moisture content and pressure head profiles during preponding and ponded rainfall infiltration, as well as the theoretically expected rainfall infiltration rates. In particular, the dependence of the above profiles and rates upon rain intensity was studied. One of the conclusions reached was that the theoretical relations between ponded rainfall infiltration rates and infiltration duration, computed for rains of various intensities, cannot be expressed by a single curve. These relations also differ significantly from the flood-water infiltration capacity-time function. (Knapp-USGS)

2H. Lakes

MOTIONS IN A MODEL GREAT LAKE DUE TO A SUDDENLY IMPOSED WIND,
Waterloo Univ. (Ontario).
G. T. Csanady.
Journal of Geophysical Research, Vol 73, No 20, p 6437-6447, Oct 1968. 11 p, 3 fig, 5 tab, 9 ref.

Descriptors: *Great Lakes, *Hydrodynamics, *Wind velocity, *Water waves, *Water currents, Rotational flow, Friction, Thermocline, Seiches, Coriolis force, Density stratification, Model study, Interfaces.
Identifiers: *Wind-stress system, Inertial periods, Coastal jets, Poincare waves.

A solution is presented for the initial value problem that arises when a uniform wind stress is suddenly imposed on the surface of a circular, constant depth, two-layer lake that has similar characteristics to the Great Lakes under summer conditions. Even with this minimum number of dynamically significant features in the theoretical model (closed basin, two-layer structure, and constant Coriolis parameter) a number of experimentally found features in the behavior of the Great Lakes are reproduced in a realistic way, the most important such phenomena being (1) large thermocline movements near the shores, (2) coastal jets, (3) rotary currents in the center portion, (4) standing internal waves of long wavelength and large amplitude, (5) standing surface seiches, and (6) rotating surface and internal seiches. Data and models are shown in tables and figures. (Sherman-Vanderbilt)

THERMAL INFLUENCE OF THE LAKE INAWASHIRO ON THE LOCAL-CLIMATE IN SUMMER DAYTIME,
Tohoku Univ., Sendai (Japan). Faculty of Science.
Hiroshi Shitara.
Sci Rep of Tohoku Univ, 7th Ser (Geogr), Vol 18, No 2, p 213-220, Mar 1969. 8 p, 8 fig, 1 ref.

Descriptors: *Lakes, *Thermal properties, *Climates, Air temperature, Winds, Cloud cover, Rain, Altitude, Micrometeorology, Weather data, Weather patterns.
Identifiers: *Japan, Lake thermal effect, Lake Inawashiro.

In this paper the author summarized the results of his daytime observations conducted in 1967 and on July 10, 1968. The air temperature difference at 1.5 m-level between the windward shore and the leeside shore is larger when the wind is blowing across the lake under the clear weather. When the air-flow from the lake surface alternates with that from the inland, there is a sudden drop in the air temperature. Horizontal air temperature change on the lake is large in the windward area, in accordance with the distance from the windward shore, while it is small in the leeside area. Vertical air temperature gradient (1.5 m - 5.0 m) under clear weather is far stronger on the windward shore than on the leeside shore. Under clear weather, the characteristics with the incoming type in micro-climate is observed in the vertical air temperature profile blow 3.0 m-level, and it disappears at a location 200 meters distant from the windward shore, and appears again in the plain near the leeside shore. The air temperature difference, between the location on the lake near the windward shore free from the micro-climate on the ground and the leeside shore, is about 2.0 deg C, which is estimated as the thermal influence of the lake surface upon the local climate, within the limits of these observations. MONTHLY SURVEY OF VITAMIN B-12 CONCENTRATIONS IN SOME WATERS OF THE ENGLISH LAKE DISTRICT,
National Inst. for Research in Dairying, Reading (England). Unit for Biochemical Research Bearing on Fish Problems.
K. W. Daisley.
Limnol and Oceanogr, Vol 14, No 2, p 224-228, Mar 1969. 5 p, 3 fig, 22 ref.

Descriptors: *Lakes, *Vitamin B, Chemical analysis, Organic matter, Nutrients, Sediments, Ecology, Algae, Seasonal, Analytical techniques, Bacteria, Mapping, Silting.
Identifiers: *England, English Lakes, Vitamin B-12.

The vitamin B-12 activity for 'Euglena gracilis' of water from 9 lakes of the English Lake District was assayed at 15 consecutive monthly intervals. Filtration through glass-fiber filters was used to differentiate between dissolved vitamin and that in gross particulate matter. The average vitamin B-12 concentrations correlated with the so-called, evolutionary series of the lakes: the primitive rocky lakes of low productivity are low in vitamin B-12 and the 'evolved' silted lakes, richer in sediments, nutrients, and organisms have higher levels of the vitamin. There is also some indication of seasonal variations at some lakes but the differences are much smaller than the seasonal algae changes. (Gabriel-USGS)

STUDIES ON THE DISTRIBUTION OF COBALT IN LAKES,
Wisconsin Univ., Madison. Limnology Lab.
Michael Parker, and Arthur D. Hasler.
Limnol and Oceanogr, Vol 14, No 2, p 229-241, Mar 1969. 13 p, 5 fig, 5 tab, 42 ref.

Descriptors: *Lakes, *Cobalt, Water chemistry, Seasonal, Statistical methods, Water temperature, Dissolved oxygen, Sampling, Drainage, Organic matter, Radioactivity, Conglomerate rocks, Photosynthesis, Phytoplankton.
Identifiers: Wisconsin lakes, Cobalt distribution.

Distribution of cobalt was investigated by adding cobalt-57 to bottles of lake water to see whether there was any seasonal change in the distribution of cobalt in filtrates (solutions) and seston after 24-hour incubation, or whether any differences in this distribution could be found between lakes. Several distinct patterns of seasonal distribution of Cobalt-57 between 'solution' and seston were observed but no explanation of the basic mechanism causing these changes can be offered. In general, direct biological uptake did not appear to be significant in removing Cobalt-57 from solution (Lake Mendota, Wisconsin). Photosyntheic activity was of little importance. Experiments with inhibitors and heated waters indicated the importance of nonbiological processes. Algae showed very little radioactivity (Gabriel-USGS)

Limnol and Oceanogr, Vol 14, No 2, Mar 1969. p 260-264, 5 p, 9 fig, 15 ref.

Descriptors: *Oligochaetes, *Lakes, *Lake Erie, Sampling, Tubificids, Estuaries, Rivers, Pollutant identification, Mapping, Runoff, Ecology, Ecological distribution.
Identifiers: Lake Erie oligochaetes.

A total of 52,390 oligochaetes were collected from 40 stations in western Lake Erie in spring 1961. The population was composed of 2 families, Naididae and Tubificidae. Only 6 species of naidids were found. One, Paranais frici, is apparently new to the list of North American freshwater Naididae. Among the 14 tubificids found, 5 species of Limnodrilus were most abundant; they contributed 90% or more of all oligochaetes at 33 of the 40 stations. Numbers of Limnodrilus were generally large near the mouths of the Detroit, Raisin, and Maumee rivers and decreased progressively lakeward. Stylodrilus heringianus, a pollution-intolerant species common in eastern Lake Erie, was not found in the western end of the lake. (Gabriel-USGS)

A HORIZONTAL WATER SAMPLER FOR INVESTIGATION OF STRATIFIED WATERS,
Wisconsin Univ., Milwaukee. Center for Great Lakes Studies.
Richard P. Howmiller, and William E. Sloey.
Limnol and Oceanogr, Vol 14, No 2, p 291-292, Mar 1969. 2 p, 3 fig, 5 ref.

Descriptors: *Sampling, *Instrumentation, *Stratification, Turbidity, Carbon, Electrical equipment, Water chemistry, Physical properties, Biological properties, Hydrologic properties.
Identifiers: Water samplers, Stratified waters.

Turbid waters frequently show physical, chemical, and biological stratification. To identify and record the data of these stratifications, a water sampler was designed. The triggering mechanism of this water sampler is similar to that used on most Ekman grabs. The sampler is designed for easy manipulation even with heavy gloves during winter sampling. The supporting line passing through the center of the triggering mechanism may continue down to support several samplers to be tripped in series. Two years of intensive year-round sampl
have shown no malfunction with this samp

stratification, Wind, Kinetics, Friction, Model s
dy, Lakes.
Identifiers: *Wind-driven circulation, *Radius
deformation, *Wind-stress system, Barocli
Barotrope.

nplified models of wind-forced motions are con-
lered in the two-layer circular basin 'model Great
ke' introduced in an earlier paper. Under
mmer conditions, when a thermocline is present,
th a uniform, steady wind and a uniform wind
rying periodically in time produce a frictionless
se response characterized by strong boundary
rrents and pronounced thermocline movements
the shore zone. The length scale determining the
dth of this shore zone is the 'radius of deforma-
n', typically three miles. Observations on Lakes
ron, Michigan, and Ontario show such motions
be present near the shores. (Sherman-Van-
rbilt)

s, *Water currents, *Coriolis force, *Hydrostatic
essure, Continuity equation, Model studies, Lim-
logy, Rotational flow, Lakes.
entifiers: *Large-scale motion, *Rossby number,
astal jets, Kelvin waves.

rge-scale motion in the Great Lakes can be as-
med to be of small Rossby number, so that the
uations of motion can be linearized and at the
me time the variation of the Coriolis parameter
th latitude can be neglected. When applied to a
o-layer lake model, the equations of motion and
e continuity equations can be reduced to two in-
pendent sets of equations for the principal 'inter-
l' and 'surface' modes. When applied to a circu-
basin, constant depth 'model Great Lake' (of
mensions and other characteristics appropriate to
e Great Lakes) the theory suggests the existence
(1) baroclinic coastal jets during the summer
atification; (2) slow counterclockwise rotating
ternal waves of a period many times the half-pen-
lum day; and (3) surface and internal seiches
tating in either direction and having a period of
most several hours (surface modes) or up to
thin a small fraction of the inertial period (inter-
l modes). An examination of the available obser-
tional material indeed suggests that these fea-
res are detectable in the Great Lakes. (Sherman-
nderbilt)

Vater currents, *Flow profiles, *Lakes,
Reynolds number, Theoretical analysis, Limnolo-
, Air-water interfaces, Laboratory tests, Hydrolo-
, Turbulence.
entifiers: Unstratified lakes, Wind-driven circula-
n.

bservations of the wind-driven circulation in the
rtical plane of unstratified lakes, including some
w results indicating a logarithmic current profile
ar the lake surface, are presented. The current
ofile was deduced from the varying velocities of
ats of different lengths at wind speeds less than
m/sec and found independent of wave action.
e velocity profile has not been measured in lake
nditions except at a depth of one meter, but in
boratory observations it has the features that (1)
e velocity and velocity gradients are large near
e surface, and (2) near the bottom there is a thin
yer where the return current is reduced to zero. A
eoretical velocity profile that is in fair agreement
th a stressdriven laboratory flow, and that may
pproximate to the steady circulation in the central section of lakes of nearly uniform depth, is developed. From this profile, an estimate is made of the effect on the wind setup of a gentle sloping lake bottom. (Sherman-Vanderbilt)

ZINC-65 IN STUDIES OF THE FRESHWATER ZINC CYCLE,
Michigan Univ., Ann Arbor. Dept. of Zoology.
Roger W. Bachmann.
Proc 1st Nat Symp on Radioecology, Colorado State Univ, Fort Collins, Sept 10-15, 1961. Radioecology, 1963, Reinhold Pub Corp, NY and Amer Institute of Biological Sciences, Wash, DC, Schultz, Vincent and Klement, Jr, Alfred W (Eds), p 485-496. 7 fig, 9 tab, 53 ref.

Descriptors: *Zinc radioisotopes, *Freshwater, Michigan, Lakes, Tracers, Detritus, Sediments, Seston, Daphnia, Mayflies, Adsorption, Mathematical models, Aquatic plants, Chelation, Synthesis, Enzymes, Algae, Sampling, Radioactivity, Hydrogen ion concentration, Temperature, Alkalinity, Zooplankton, Benthic fauna, Calcium, Magnesium, Potassium, Sodium, Phytoplankton.
Identifiers: *Zinc cycle, Ann Arbor (Mich), Golenkinia paucispina, Daphnia pulex, Daphnia magna, Ephemera simulans, Suspended materials, Inorganic complexes, Elodea canadensis, Ceratophyllum demersum, Potomogeton richardsonii, Ankistrodesmus, Radionuclide uptake.

Author determined quantitatively some of the factors affecting distribution of zinc between the water and various solid materials in lakes. The uptake of zinc by suspensions including Golenkinia paucispina, organic detritus, lake sediments, and natural lake seston was measured with zinc-65, as tracer; and zinc uptake by Daphnia pulex and Daphnia magna was followed. Daphnia pulex takes up zinc primarily from particles to which zinc is adsorbed. When nymphs of Ephemera simulans were present, the zinc was mixed into sediments and approached a uniform distribution. Nymphs did not accumulate a significant fraction of zinc available. Theoretical curves were derived predicting zinc distribution between liquid and solid phases in lakes as a function of total zinc content and suspended material mass. A theoretical outline of the freshwater zinc cycle was then presented, characterized by exchanges between dissolved zinc and various organic and inorganic suspended materials, including rooted aquatic plants and bottom sediments. Transfer of zinc to sediments by sedimentation of adsorbents seem to be a mechanism for removal of the ion from lake waters. Accumulation of zinc in sediments should result. Formation of organic chelates and inorganic complexes may be factors altering the scheme proposed. (See also Vol 2, No 19, Field 5C, W69-07863). (Jones-Wis)

Phosphorus (Inorganic), Phosphorus (Soluble organic), Phosphorus (Colloidal), Phosphorus (Soluble reactive), Phosphorus (Total), Millipore filtration, Toronto (Ont), Algonquin Provincial Park (Ont), Canada, Ontario, Lake size, Urban drainage, Bog lakes, Grenadier Pond (Ont), Heart Lake (Ont), Teapot Lake (Ont), Mary Lake (Ont), Eos Lake (Ont), Costello Lake (Ont), Opeongo Lake (Ont), Lake of Two Rivers (Ont), Found Lake (Ont).

Author reports concentrations of inorganic phosphorus (P), soluble organic P, and seston P, studied throughout one year in nine Ontario lakes, differing in size total P concentration, and water color. Percentages of total P occurring as soluble organic P were similar in eight lakes (range: 25.0-31.7%), and divergent (12.5%) in extremely eutrophic Grenadier Pond, which receives urban drainage. Author accounts for differences between his results and those reported in the literature by others as due to varied techniques used, and presents experimental evidence to support this view. Millipore filtration (pore diameter: 0.1 micron) reduced soluble organic fraction to 18% of total P. Turnover time of inorganic P was less than 10 minutes in all lakes during summer, but increased in winter (in Heart and Mary Lakes, by as much as three orders of magnitude). Report presents experimental data to show that use of unwashed Millipore filters adds P to filtrate. (Eichhorn-Wis)

ON THE CONSEQUENCES WHICH LOWERINGS OF THE WATER LEVEL FOR AGRICULTURAL PURPOSES HAVE ON MACROPHYTIC AND PLANKTONIC COMMUNITIES OF SHALLOW LAKES WITHIN THE OLIGOTROPHIC AREA OF SOUTH SWEDEN, (GERMAN),
Lund Univ. (Sweden). Limnological Inst.
Sigvard Lillieroth.
Acta Limnologica 3, 1950, Carl Bloms Boktryckeri, Lund, Sweden. 288 p, 64 fig, 26 tab, 158 ref.

Descriptors: *Eutrophication, *Lakes, *Phytoplankton, Shallow water, Nutrients, Plankton, Water levels, Water level fluctuations, Aquatic plants, Drainage effects, Drawdown.
Identifiers: *Sweden, *Macrophytes, *Auxotrophication, Phragmites, Scirpus, Typha, Equisetum fluviatillis, Gyttja.

The biomass of aquatic vegetation was studied in five shallow lakes located in an limnologically uniform area of glacial deposits. The water level of three of these lakes was lowered from 1.2 to 2.0 meters by artificial drainage of surrounding wet lowlands. This amelioration induced an increase of nutrients for both macrophytes and microphytes. The increased fertility of the lakes was particularly reflected in the colonization of available areas of gyttja by gramineous communities, largely those of Phragmites, Scirpus, Typha, and Equisetum fluviatile. The eutrophication of the lakes was interpreted as 'auxotrophication,' a term implying an augmented productive capacity of the basin due to either an increase in concentration of soluble salts, or a mobilization of previously unutilized latent supply of nutrients. 2I. Water in Plants

CO sub 2 - GAS EXCHANGE AND WATER RELATIONS OF PLANTS IN THE NEGEV DESERT AT THE END OF THE DRY PERIOD,
Hebres Univ., Jerusalem (Israel).
O. L. Lange, W. Koch, and E. D. Schulze.
Ber. Deutsch Botan Gesell, bd 82, hft 1/2, p 39-61, 1969. 23 p, 19 fig.

Descriptors: *Moisture stress, *Photosynthesis, *Arid climates, Deserts, Arid lands, Drought resistance, Heat resistance, Physiological ecology, Plant physiology, Stomata, Transpiration control, Water.
Identifiers: Israel, Negev Desert, CO sub 2.

The aim of this study was the clarification of how different plants survive the dry period and to what extent positive net-photosynthesis under high water stress is possible. In order to investigate the gas exchange under the most natural conditions, the experimenters used the Siemens gas-exchange chamber with temperature and humidity control. This control allowed elimination of the glasshouse effect. Daily net-photosynthesis and transpiration were determined under natural diurnal course conditions. In addition, a number of experiments were performed in order to analyze the effect of the temperature, independent from the ambient. Under natural conditions, the diurnal course of net-photosynthesis varies in number and form of peak according to the species. It was shown that increased resistance as well as the mid-day closing of the stomata are brought about directly by the temperature. This reaction, temperature species specific, protects the plant against further impairment of its already stressed water conditions. The same leaf temperature in the presence of different water contents can have an entirely different effect, temperature sensitivity being increased with a corresponding water stress. The daily balance of the net-assimilation and the assimilation-transpiration quotient of several wild and cultivated plants are compared. Perennial desert xerophytes are able to stabilize their water relations in a manner that allows them to maintain positive daily balance of the CO sub 2 gas exchange even at the end of the period. 2J. Erosion and Sedimentation

STUDY OF EROSION PHENOMENA AND UNCONSOLIDATED DEPOSITS IN BAIE-SAINT-PAUL-SAINT-URBAIN AREA, CHARLEVOIX COUNTY,
Department of Natural Resources, Quebec. Geological Exploration Service.
Jean-Y. Chagnon.
Geol Explor Serv, Quebec Dep Natur Resources Spec Pap No 3, 1969. 29 p, 6 fig, 8 plate, 8 ref.

Descriptors: *Erosion, *Sediments, *Topography, *Deposition (Sediments), Drainage, Bedrock, Rivers, Geology, Quaternary period, Glaciation, Gravels, Sands, Clays, Lakes, Rain, Remedies, Erosion control, Landslides.
Identifiers: *Canada, Quebec, Charlevoix County.

This report presents a study of unconsolidated sediments in Charlevoix County, Quebec, with a special reference to the erosion phenomena taking place along the Gouffre River. The results of the erosive processes are evident at numerous points along the Gouffre River Valley. Landslides, riverbank erosion, solifluction, and reptation phenomena are abundant, and the river causes considerable damage to the riparian farms. The report describes the topography, drainage, bedrock, and geology of unconsolidated deposits and suggests some methods to control the erosive processes taking place in the Baie-Saint-Paul-Saint-Urbain Area. THE BEHAVIOR OF STRAIGHT OPEN CHANNELS WITH MOVABLE BEDS,
Geological Survey, Washington, D.C.
Thomas Maddock, Jr.
Geol Surv Prof Pap 622-A, p A1-A70, 1969. 70 p, 52 fig, 3 tab, 60 ref.

Descriptors: *Alluvial channels, *Sediment transport, *Channel morphology, Open channel flow, Regime, Sedimentation, Model studies, Hydraulic models, Hydraulics, Bed load, Particle size, Particle shape.
Identifiers: Alluvial channel behavior.

The chief variables related to the behavior of alluvial channels are mean velocity, depth, width, slope, quantity of sediment transport, and sediment size composition. Because changes in one variable result in mutual adjustment of all other variables, the actual results depend on the constraints that may be imposed, either natural or artificial. Analysis of flume data indicates that no single simple equation describes the relation between mean velocity and load, the sediment discharge per foot of width of channel. Different equations for unigranular sediment and for sediment mixtures are proposed. These equations are based on flume data and are tested with data collected in the field. (Knapp-USGS)

THE LACUSTRINE BEDS OF WADI FEIRAN, SINAI: THEIR ORIGIN AND SIGNIFICANCE,
Geological Survey of Israel, Jerusalem. Hydrogeology Div.
A. Issar, and Y. Eckstein.
Israel J Earth-Sci, Vol 18, No 1, p 21-27, 1969. 7 p, 11 fig, 9 ref.

Descriptors: *Lake beds, *Arid lands, *Sedimentation, Sediments, Deposition (Sediments), Erosion, Sediment transport, Paleolimnology, Paleoclimatology, Pleistocene epoch.
Identifiers: Israel, Sinai.

Wadi Feiran and its tributaries, Sinai, dissect a series of yellowish silt s and clays interbedded with minor sands and gravels. They are considered to originate from local lacustrine or swampy conditions, which were intermittently disrupted by violent floods. Deposits of several such ancient shallow lakes or swamps were observed at different topographic levels, separated by natural barriers of resistant dikes. The lakes are thought to have been formed during late Plio-Pleistocene times, when more humid climatic conditions prevailed. (Knapp-USGS)

CHARACTERISTICS OF SEDIMENTATION THE SHELF OF SOUTHWESTERN AFRICA
Atlantic Scientific Res Inst. of Fisheries Oceanogr., Kaliningrad (USSR).
Yu. M. Senin.
Transl from Russian Litologiya i Polezn Iskop 4, p 108-111, July-Aug 1968. Lithology Mineral Resources, N o 4, p 476-479, July 1968. 4 p, 1 fig, 1 tab, 12 ref.

Descript ors: *Sedimentation, *Marine geo *Atlantic Ocean, *Continental shelf, Arid clim Weathering, Runoff, Nutrients, Ocean curr Biomass, Zooplankton, Phytoplankton, Temp ture, Water chemistry, Silts, Clays, Phospho Sands.
Identifiers: *Africa, Shelf sediments.

Results of studies of 180 bottom samples of tinental shelf sediments from southwestern Af collected in 1963-1964, are presented. The e ples were analyzed by using microscopic, gr lometric and chemical methods. In general hydrologic conditions of this shelf (in an arid mate) are determined by the complex interac of the waters of the cold Benguela Current, warm and saline waters of a southern current deep waters which upwell onto the shelf. dynamic regime of the shelf is characterized considerable activity; the speed of the Beng Current is about 25 cm/sec. and the speed of and-flow tides is 25 cm/sec. The climatic hydrochemical characteristics of the region clearly reflected in the physical and chemical c positions of the bottom sediments and in the tribution of their granulometric and phys genetic types. One of the characteristics of the s sediments is the widespread occurrence of rigenous, diatomaceous, and glauconitic sedime where the formation of diatomaceous oozes glauconitic sands is obviously related to the st constant upwelling of cold deep waters. nsl from Russian Litologiya i Polezn Iskop, No p 148-153, July-Aug 1968. Lithology and neral Resources, No 4, p 521-526, July-Aug 8. 6 p, 1 fig, 2 tab, 10 ref.

scriptors: *Mathematical studies, *Mathemati- models, *Clays, *Settling velocity, *Hydraulic dels, Velocity, Stokes law, Hydraulic properties, imentation.
ntifiers: *Granulometric analysis, Clay particle ling.

purpose of this brief article is to give an ac- nt of the separation of clay fractions, estimation he hydraulic method of granulometric analysis, the selection of the optimal condition for max- m preservation of particles with a diameter less n 0.01 mm. The rate of settling was investigated sing the Stokes formula modified by B. V. Ark- gel, Skiy (1935) and several decantations. It found that one isolated particle settles more idly than a group of interacting particles; parti- of diameter 0.01-0.05 mm have a velocity scat- ng of 50%, and particles of diameter 0.05-0.1 , 20%. This indicates a decrease of particle in- ction with an increase of diameter. The All on Research Institute method of granulometric lysis was found to be the most reliable for bed relation since losses of particles of the limiting meter in this case are minimized. The article usses the sources of possible errors in studying settlement of particles under still-water condi- s. (Gabriel-USGS)

ntifiers: *Romania, River bed consolidation.

dams built in the 18th century in Romania had provision for consolidation below the dam. Most these dams were either abandoned or lernized. A dissipation basin was designed to in the water at the dam foot for any variation of er level downstream. This paper discusses the oretical consideration which needs to be taken downstream consolidation. Coriolis force, ude number and other hydraulic conditions are ussed. It is recognized that the movement of cohesive bed particles by a macio-turbulent is different from the movement of particles in ormal turbulent flow. Critical velocity of bed erial depends on the specific density, ivalent diameter, relative roughness, and inten- of macroturbulence. The initial movement of icles is related to the frontal hydrodynamic e, upward lifting force, and friction force. The th of consolidation and depth of scouring nstream from dams are recommended mea- sures in preventing the uncontrolled erosion of river banks and watercourses. Graphical and mathematical models for their computation are given. (Carstea-USGS)

CALCULATION OF THE AMOUNT OF LITTORALLY DRIFTED SAND,
Latgiproprom Planning Inst.
R. Ya. Knaps.
Transl from Okeanologiya, Akad Nauk, SSSR. Oceanology, Vol 8, No 5, p 680-687, 1968. 8 p, 2 fig, 19 ref.

Descriptors: *Coasts, *Beaches, *Sands, *Sediment transport, *Waves (Water), *Littoral drift, Deposition (Sediments), Currents (Water), Winds, Surf, Ocean currents.
Identifiers: USSR, Wind energy calculations.

Shallow sandy coasts are liable to large-scale littoral drifting, largely as a result of currents caused by storms. Wave action causes roiling at the bottom and the waves themselves carry considerable energy into the inshore area. A large part of the energy is dissipated in the breaker zone and a further part is imparted to currents flowing in directions very different from that of the waves. Wave methods do not offer much promise for calculating littoral drift on sandy coasts. Examples are given which confirm this. The best methods of calculating the movement of drift sand are wind-energy methods, which take account of the combined effects of wind, currents and waves. (Knapp-USGS)

Transl from Okeanologiya, Akad Nauk, SSSR. Oceanology, Vol 8, No 5, p 687-692, 1968. 6 p, 2 fig, 1 tab, 12 ref.

Descriptors: *Beaches, *Sediment transport, *Deltas, Waves (Water), Currents (Water), Rivers, Streamflow, Alluvium, Aggradation, Geomorphology, Littoral drift.
Identifiers: *USSR, *Danube delta.

The Kiliya arm of the Danube delta is a very youthful geological formation. Its development is very rapid, particularly in those areas where the largest volume of river sediment is deposited and where wave action is light. As a result, as shown by field investigations and an analysis of cartographic material, the northern and southern portions of the delta advance most rapidly, while the central portion is relatively steady. This pattern of development agrees well with earlier schemes of the evolution of the delta. It is also important to shipping interests. Since the distribution of alluvium on the beach depends on the dynamics of the beach deposits, vectors of sediment-moving forces were plotted by the Shishov-Knaps-Pravotorov method. The character of these vectors is quite consistent with the geomorphology of the beach and substantiates the general opinion on the direction of beach drifting. (Knapp-USGS)

STOCHASTIC MODEL FOR THE DEPOSITION OF VARVES IN GLACIAL LAKE BARLOW-OJIBWAY, ONTARIO, CANADA,
Geological Survey of Canada, Ottawa (Ontario).
F. P. Agterberg, and I. Banerjee.
Can J Earth Sci, Vol 6, No 4, Part 1, p 625-651, Aug 1969. 27 p, 15 fig, 5 tab, 49 ref.

Descriptors: *Sedimentation, *Varves, *Statistical models, Stochastic processes, Markov processes, Annual, Beds, Seasonal, Clays, Silts, Sands, Deposition (Sediments), Glaciation, Glacial drift.
Identifiers: Canada, Ontario.

Various methods of time series analysis have been applied to thickness data obtained from eight measured sequences of varves belonging to the Pleistocene glacial Lake Barlow-Ojibway in northern Ontario. Both sedimentological evidence and the results of the statistical analysis support Kuenen's model for varve deposition by turbidity currents. Proximally, individual varves merge with the crossbedded deltaic sands and gravel of eskers. Distally, they change successively from sandy to silty, and then to diamictic facies. Both the silt (summer) and the clay (winter) layers in a varve couplet show an approximately exponential decrease in thickness away from the icefront. This trend is more conspicuous in the silt. The genetic difference between the silt (deposited by turbidity currents) and the clay (deposited out of suspension) is reflected in marked differences in the statistical behavior of their thickness-time series. The thickness variations of both silt and clay layers can be considered as the sum of a gradual, systematic variation (signal) and a random variation (noise). When the effect of the thinning away from the icefront and that of the superimposed noise are eliminated, both the silt and clay residual thickness data satisfy a Markov model of the second order. This model is shown to be related to variations in the rate of retreat of the icefront. Besides the second order Markov process, two weakly-developed short-term cycles have also been detected. (Knapp-USGS)

SEDIMENTATION IN UPPER ARROW LAKE, BRITISH COLUMBIA,
Geological Survey of Canada, Calgary (Alberta).
R. J. Fulton, and M. J. L. T. Pullen.
Can J Earth Sci, Vol 6, No 4, Part 1, p 785-791, Aug 1969. 7 p, 7 fig, 2 ref.

Descriptors: *Sedimentation, *Deltas, *Lakes, *Columbia River, Beds, Deposition (Sediments), Rivers, Sedimentary structures, Turbidity currents.
Identifiers: *Canada, British Columbia, Arrow Lake.

Two rivers, the Columbia and the Incomappleux, empty into the north end of Upper Arrow Lake. The form and the general pattern of sedimentation of the two river deltas were determined by an echo sounder survey. The t hree classical delta sedimentation zones were recognized and observations made on sedimentation in each. Sedimentation in the topset zone is largely channel and overbank deposition similar to that taking place on river floodplains. The bottomset zone receives fine silt and clay carried out to where it can settle under lacustrine conditions. The bulk of the sediment is deposited at the river mouths near the top of the foreset zone. Following initial deposition, the sand and silt dumped at the river mouths is carried into the lake basin by a slow sliding failure of the entire foreset zone. (Knapp-USGS)

THE DETRITAL MINERALOGY OF OCEAN FLOOR SURFACE SEDIMENTS ADJACENT TO THE ANTARCTIC PENINSULA, ANTARCTICA,
Florida State Univ., Tallahassee. Dept. of Oceanography; and Florida State Univ., Tallahassee. Dept. of Geology.
Dennis S. Edwards, and H. Grant Goodell.
Marine Geol, Vol 7, No 3, p 207-234, June 1969. 28 p, 23 fig, 2 tab, 42 ref.

Descriptors: *Sediments, *Antarctic ocean, *Mineralogy, Provenance, Geology, Sediment transport, Ice, Currents (Water).
Identifiers: Antarctic ocean sediments.

The detrital mineralogy of the 62-125 micron size fraction of the marine sediments adjacent to the Antarctic Peninsula delineates 3 sedimentary mineralogical provinces. Western Weddell Sea sediments are dominated by a suite of metamorphic minerals which probably originates along the southern coast of the Weddell Sea. The sediments of the eastern Bellingshausen Sea are composed of a granitic suite originating largely from the rocks of the Andean intrusive, which dominates the geology of the Antarctic Peninsula. The sediments surrounding and to the north of the South Shetland Islands overwhelmingly consist of a volcanic extrusive suite derived from the insular volcanism. Ice rafting is considered the primary mode of transport, although in rare instances deep currents appear to have concentrated heavy minerals into placer or lag deposits. (Knapp-USGS)

SOUTH PACIFIC SEDIMENT DISTRIBUTION,
Lamont-Doherty Geological Observatory, Palisades, N.Y.
M. Ewing, R. Houtz, and J. Ewing.
J Geophys Res, Vol 74, No 10, p 2477-2493, May 15, 1969. 17 p, 16 fig, 29 ref.

Descriptors: *Sediment distribution, *Pacific Ocean, *Seismic studies, *Marine geology, Trenches, Climatic zones, Structural geology, Velocity, Bottom sediments, Water circulation, Buoys, Detritus, Biological properties, Diatoms, Clays, Turbidity currents, Gravity, Antarctic Ocean.
Identifiers: *Sediment isopach map, Sea-floor spreading.

This paper gives sediment distribution, a sediment isopach map, velocity-depth curve, and several seismic profile sections based on seismic profiler data from about 200,000 km of tranverse in the South Pacific. The data reveal in some detail the marginal trench sediments and the sediments of equatorial and subsequatorial zones. Recent sea-floor spreading is indicated by an abrupt thinning of sediments near the crest of the Pacific-Antarctic ridge, with the spreading, it seems, related to possible large-scale vertical movements in Melanesia. The sediment distribution, except near the mid-ocean ridge, in subantarctic waters, seems to depend mainly on the effects of a former northerly location of the polar front and on modern bottom currents. A CONCEPTUAL MODEL OF KARSTIC EROSION BY GROUNDWATER,
Water Planning for Israel Ltd., Tel Aviv.
S. Mandel.
Hydrol of Fractured Rocks Vol 2, Proc Dubrovnik Symp (Oct 1965), Int Ass Sci Hydrol, Pub 74, p 662-664, 1967. 3 p, 7 ref.

Descriptors: *Erosion, *Karst, *Groundwater basins, *Groundwater movement, Solubility, Channels, Springs, Aquifers, Isotropy, Porosity, Hydrologic properties, Water levels, Limestones, Fissures (Geology), Water types, Water table, Topography.
Identifiers: *Israel, Karstic erosion.

This article is a generalized description of the process of karstic erosion by groundwater mainly based on earlier investigations of the karstic areas in Israel. The author assumes that in saturated zones of calcareous aquifers the process of erosion by solution proceeds at a very slow pace and consists of two correlated phenomena. The phenomena are: (1) solution channels are formed and widened in the vicinity of springs where a strong flow-concentration occurs; and (2) an intricate system of solution channels develops, the dominant characteristic of which is its direction toward the outlet. Direction of groundwater flow is the determining factor in karstic development of calcareous aquifers and the lithological variations, faults and fissures are of secondary importance. A regional system of solution channels can be established only if the general hydrologic conditions remain practically constant during long time intervals. (Gabriel-USGS)

CHEMISTRY OF THE SAN JOAQUIN RIVER SYSTEM UNDER BASE FLOW CONDITIONS,
Agricultural Research Service, Fresno, Calif. Ground Water Recharge Field Station.
Harry I. Nightingale, and Jerold J. Behnke.
J Amer Water Works Ass, Vol 61, No 8, p 382-386, Aug 1969. 5 p, 5 fig, 7 ref.

Descriptors: *Water quality, *Streamflow, *California, *Rivers, *Water chemistry, Solutes, Groundwater, Water analysis, Irrigation water, Reservoirs, Springs, Lakes, Precipitation (Atmospheric).
Identifiers: *San Joaquin River.

A water quality survey was made of the San Joaquin River, California, from its origin in the Sierra Nevada to its entry into the east side of the San Joaquin Valley. The base flow of the river system is considerably modified by dams, diversion tunnels, and pipelines for power projects, flood control, and irrigation, all of which alter water quality. From an irrigation standpoint, the quality of all the waters sampled within the San Joaquin River System (with the exception of West Chiquito Creek) was excellent. Although the salt content of the waters was quite low and all the waters were derived from essentially granitic terrain, marked chemical differences did exist between the source lakes and the river tributaries. Mammoth Pool contained more dissolved salts in somewhat different proportions than Huntington and Shaver Lakes. This difference is probably attributable to the fact that some of the higher drainage areas associated with Mammoth Pool contain volcanic and metavolcanic rocks and associated thermal springs, whereas the drainage basins for the 2 other lakes are composed almost exclusively of granitic material. The chemical differences observed in the tributary streams were generally attributed to differences in rock type in the drainage basin, groundwater return flow, or unusual spring discharges. There is approximately an increase in salinity of 6.2 in the water of the San Joaquin River System from its snow origin in the high Sierra Nevada to the eastern edge of the San Joaquin Valley. Most of the salinity increase takes place when the water infiltrates below the ground surface. The displacement of high quality lake waters by tunnels and pipes for hydroelectric power generation has probably proved the chemistry of the river by maintaini firm base flow composed of high quality w stored in the Sierra Nevada lakes. entifiers: *USSR, *Murman Coast, Tidal pools.

he hydrological and hydrochemical conditions in de pools are considerably different from those in e inshore sea area. The greatest variations of ydrochemical conditions and differences from onditions in the sea are found in the supralittoral one. In summer, the temperature in the pools ex-eeds that of the sea, but the salinity is lower espe-ally in the surface layers, while the oxygen con-nt is higher than in the sea. In some supralittoral ools the oxygen concentration may reach 300-00% saturation. However, at low tide at night it ay fall to 13%. The concentration of phosphates nd nitrates in some shallow littoral pools may be 0-30 times greater than in the sea, probably ecause of the action of mussels which inhabit the ools. In autumn hydrochemical differences etween the pools and the sea are small and the ool temperature is below that of the sea, some-mes falling to 5 deg C or even 8 deg C. The salini-in the pools is higher than in the sea, and may ach 130-145 pp+ because of the precipitation of lt during ice formation. In spring the melting of e snow considerably reduces the salinity in the ools. Algal photosynthesis raises the amount of xygen to 200-300% saturation. The concentration nutrients decreases because of their consump-on by algae. (Knapp-USGS)

ISTRIBUTION OF METHANE AND CARBON ONOXIDE BETWEEN THE ATMOSPHERE ND NATURAL WATERS,
aval Research Lab., Washington, D.C.
W. Swinnerton, V. J. Linnenbom, and C. H. heek.
nviron Sci and Technol, Vol 3, No 9, p 836-838, ept 1969. 3 p, 4 fig, 13 ref.

Descriptors: *Methane, *Seawater, *Atmosphere, *Estuaries, *Surveys, Water pollution effects, Path of pollutants, Water quality, Water chemistry, Equilibrium, Thermodynamic behavior, Mass transfer, Aqueous solutions.
Identifiers: *Carbon monoxide, Potomac River, Chesapeake Bay.

Methane and carbon monoxide concentrations in the atmosphere and in natural waters were measured during an oceanographic cruise between Washington, D.C. and Puerto Rico. The concentration of methane was highest in the upper Potomac River and decreased as the ocean was approached. Methane was at equilibrium between the atmosphere and the open ocean, where its average concentration in the atmosphere was 1.24 ppm. Conversely, carbon monoxide concentrations increased in the open ocean relative to the river and bay waters. Equilibrium was not observed for carbon monoxide, and the net transport of this gas appears to be from the water into the atmosphere for all samples analyzed. Atmospheric carbon monoxide concentrations ranged from 0.075 to 0.44 ppm. (Knapp-USGS)

OXYGENATION OF HYDROGEN SULFIDE IN SEAWATER AT CONSTANT SALINITY, TEMPERATURE, AND pH,
Washington Univ., Seattle. Dept. of Oceanography.
Joel D. Cline, and Francis A. Richards.
Environ Sci and Technol, Vol 3, No 9, p 838-843, Sept 1969. 6 p, 7 fig, 2 tab, 20 ref. Grant No GA-64 NSF.

Descriptors: *Oxidation, *Sulfides, *Seawater, *Water chemistry, Sulfates, Sulfur, Sulfur compounds, Biodegradation, Sulfur bacteria, Chemical reactions, Laboratory tests, Hydrogen sulfide.
Identifiers: *Sulfites.

The kinetics of the reaction between sulfides and oxygen in seawater (S= 30.27%) at 9.8 deg C are described. The rate of change of concentrations of total sulfide, oxygen, thiosulfate, sulfite, and pH were determined. Total sulfide, thiosulfate, and sulfite were determined colorimetrically, oxygen chromatographically, and pH electrometrically. The reaction is complex, as indicated by the variety of products, but the temporal course of the reaction generally follows mixed second-order kinetics after the first few hours of the reaction. The apparent rate constants for oxygen and total sulfide were .0015 in the concentration ranges investigated. The major reaction products were thiosulfate and sulfate, with sulfite occurring as an unstable but fairly long-lived intermediate product. The reaction rate decreases as the solid surface area increases. (Knapp-USGS)

DETERMINATION OF PHOSPHATE IN NATURAL WATERS BY ACTIVATION ANALYSIS OF TUNGSTOPHOSPHORIC ACID,
Bureau of Commercial Fisheries, Ann Arbor, Mich. Biological Lab.; and Wayne State Univ., Detroit, Mich. Dept. of Chemistry.
Herbert E. Allen, and Richard B. Hahn.
Environ Sci and Technol, Vol 3, No 9, p 844-848, Sept 1969. 5 p, 5 fig, 2 tab, 8 ref.

Descriptors: *Analytical techniques, *Water analysis, Neutron activation analysis, *Trace elements, *Water chemistry, Chemical reactions, Phosphates.
Identifiers: *Tungsten analysis.

Activation analysis may be used to determine quantitatively traces of phosphate in natural waters. Methods are subject to interference by sulfur and chlorine. If the ratio of phosphorus to sulfur or chlorine is small, as it is in most natural waters, accurate analyses by these methods are difficult to achieve. In the activation analysis method, molybdate and tungsate ions are added to samples containing phosphate ion to form tungstomolybdophosphoric acid. The complex is extracted with 2,6-dimethyl-4-heptanone. After activation of an aliquot of the organic phase the gamma spectrum is essentially that of tungsten-187. The induced activity is proportional to the concentration of phosphate in the sample. A test of the method showed it to give accurate results at concentrations of 4 to at least 200 ppb of phosphorus when an aliquot of 100 microliters was activated. By suitable reagent purification, counting for longer times, and activation of larger aliquots, the detection limit could be lowered several hundredfold. (Knapp-USGS)

ON BICARBONATE DETERMINATION IN NATURAL WATER (ROMANIAN),
Dumitru Ceausescu.
Hidrotehnica, Gosp Apelor, Meteorol, Vol 13, No 3, p 147-149, Mar 1968. 3 p, 1 tab, 12 ref.

Descriptors: *Bicarbonates, *Analytical techniques, *Water chemistry, Acidity, Alkalinity, Indicators, Anion exchange, Cation exchange, Water properties, Acids.
Identifiers: Bicarbonate measurement.

The three most commonly used methods for determination of bicarbonates in water are discussed. These methods are: (1) Titration with a strong acid in the presence of an indicator. However, the carbonates and other hydroxyls are also measured at high pH values; (2) calculation of carbonates from total carbonic acid and pH; Measurement of pH should be very accurate, since only small errors in pH measurement will be appreciably increased in the amount of bicarbonates; and (3) measurement of all cations and all anions except bi carbonates. The difference between cations and anions thus calculated is considered to represent the amount of bicarbonates. The humates are included in bicarbonates by using the last method. A new method is proposed by the author which is simple, rapid, direct and free of interferences. The total content of weak anions is determined by titration with a strong acid in a carbon dioxide-free atmosphere

and in the presence of a mixed indicator. This operation is then followed by a back titration with a strong base to the initial pH of water. The difference between the two titrations represents the amount of bicarbonates. At pH 7 -8.4, the carbonates are also included in this value. (Carstea-USGS)

TUFF-DEPOSITING WATER TYPES AND CORROSION INTENSITY IN THE NORTHWESTERN PART OF THE DINARIC KARST,
Ivan Gams.
Hydrol of Fractured Rocks Vol 2, Proc Dubrovnik Symp (Oct 1965), Int Ass Sci Hydrol, Pub 74, p 684-689, 1967. 6 p, 4 tab.

Descriptors: *Geochemistry, *Spring waters, *Chemical analysis, Springs, Rivers, Karst, Calcium compounds, Magnesium, Sulfates, Hardness (Water), Lakes, Limestones, Temperature, Silica, Precipitation, Runoff.
Identifiers: *Yugoslavia, Hydrochemical measurments, Tufa deposits.

Water composition and the character of depositions in rivers and springs of the northwestern Dinaric Karst were investigated by recording temperatures, CaO, MgO, and sulfate contents, mean precipitation, runoff, and the volume of rocks in solution. River tuff deposits occur where the tributaries are carrying water rich in MgO or sulfite. Karstic springs in Slavonia rich in CaO or CaO+ MgO and other minerals, are characterized by their tuff deposits. The highest corrosion intensity occurs in the carbonaceous sediments characterized by high runoff and covered with soil. Geological composition, vegetation, soil, precipitation and land use have a strong effect on the degree of corrosion intensity. (Gabriel-USGS)

CHEMICAL DECOMPOSITION OF NITRITE IN SOILS,
Iowa State Univ., Ames. Dept. of Agronomy.
J. M. Bremner, and D. W. Nelson.
Transactions 9th Int Congress of Soil Science, Vol II, Paper 52, p 495-503, 1968. 4 tab, 21 ref.

Descriptors: *Chemical degradation, *Nitrites, *Soil chemistry, Nitrogen, Nitrogen compounds, Nitrogen cycle, Cycling nutrients, Water pollution sources, Soils.
Identifiers: Nitrogen balance, Nitrogen losses (Soils), Nitrite decomposition.

Recent investigations at Iowa State University of the factors affecting chemical decomposition of nitrite in soils and mechanisms of nitrite decomposition are reviewed by the authors. Nitrite decomposition in soils is controlled largely by soil pH and organic matter content, and is due to reaction of nitrite with soil organic matter and to self-decomposition of nitrous acid. Treatment of neutral and acidic soils with nitrite leads to fixation of nitrite-nitrogen and to volatilization of nitrite-nitrogen as nitrogen, nitrogen dioxide, and nitrous oxide. Nitrite-nitrogen lost by nitrite decomposition can be recovered quantitatively as (nitrate plus fixed plus nitrogen plus nitrogen dioxide plus nitrous oxide) minus nitrogen. Phenolic substances in soil organic matter react readily with nitrite under soil conditions to form nitroso-phenols that are decomposed by nitrous acid with formation of nitrogen and nitrogen dioxide. CONTROL OF MIXED-SUBSTRATE UTILIZATION IN CONTINUOUS CULTURES OF ESCHERICHIA COLI,
Massachuset ts Inst. of Tech., Cambridge. Dept. of Nutrition and Food Science.
Richard S. Silver, and Richard I. Mateles.
J Bacteriology, Vol 97, No 2, p 535-543, Feb 1969. 6 fig, 2 tab, 40 ref.

Descriptors: *Bacteria, Enzymes, Growth chambers, Organi c compounds, Genetics, Growth rates.
Identifiers: *Escherichia coli, *Chemostat, *Substrate utilization, Escherichia coli B6, beta-galactosidase, Aspartase, Steady-state growth, Glucose, Lactose, L-aspartic acid, Constitutive mutant, Continuous culture.

Authors deal with mechanisms controlling rate of utilization of glucose and lactose by Escherichia coli B6, but the technique could be applied to testing preferential use of any simple mixture of metabolites by pure cultures. By the chemostat principle of continuous growth at steady state (level controllable), the growth rate is set at any level by rate of supply of nutrients. Analyses for growth rate, ratio of metabolites in the washout, and specific enzyme levels and their activity, indicate the control mechanisms of the differential utilization. In the case studied, constitutive mutants for beta-galactosidase emerged; glucose and lactose were both utilized at low growth rates but only glucose at high growth rates. Catabolic repression was the primary mechanism of beta-galactosidase level and thus of lactose utilization. With L-aspartic acid, direct anabolic utilization for protein synthesis and catabolic incorporation occurring simultaneously, allowed uti lization at even low levels of the catabolic enzyme concerned. Mixed populations of microorganisms and of complex mixed metabolites would not allow analyses of specific catabolite repression, but the chemostat principle of controlled steady-state growth might be useful in studies with aquatic bacteria. Analytical Biochemistry, Vol 29, No 1, p 22-3 Apr 1969. 4 tab, 9 ref.

Descriptors: *Chemical analysis, *Nitrogen.
Identifiers: *Mass spectrometry, *Nitrogen-1 *Nitrogen enrichment, *Dumas procedur Nitrogen analyzer.

The authors describe a rapid, accurate, Duma method for determining nitrogen-15 enrichmen from 0.37 to 100%. Compounds with only on nitrogen atom exhibit random pairing, bu equilibration is incomplete in compounds with tw or more variously bonded (nitrogen-nitrogen, o ygen-nitrogen, and carbon-nitrogen) nitroge atoms. Failure to equilibrate is presumed to resu from differences in bond energy between nitroge and adjacent atoms. Modifications of the Colema Model 29 nitrogen analyzer for use in collectin samples for nitrogen-15 measurement a described. (Keeney-Wis)

DETERMINATION OF SOIL CATIO EXCHANGE CAPACITY BY A SIMPL SEMIMICRO TECHNIQUE,
Wisconsin Univ., Madison. Dept. of Soils.

). R. Keeney, and J. M. Bremner.
oil Science, Vol 107, No 5, p 334-336, 1969. 1
ab, 11 ref.

Descriptors: *Soil chemistry, *Cation exchange, Chemical analysis, Ammonium compounds.
Identifiers: *Cation exchange capacity, Ammonium retention, Ammonium fixation.

The authors describe a cation exchange capacity (CEC) method which does not involve removal of he excess saturating cation by exhaustive washing rocedures, thus eliminating sources of error in this etermination due to salt retention, loss of the ndex cation by hydrolysis, or sample dispersion. In his method, the soil sample is treated with amonium acetate (1 Normal, pH 7), the ammonium cetate removed by leaching with an ammonium-itrate solution, and the treated sample analyzed irectly for ammonium-nitrogen by steam distillaon with sodium chloride (2 Moles) and magnesim oxide after partial removal of ammonium itrate by washing with a small amount of sopropanol. The amount of nitrate-nitrogen in the ample is subsequently determined by steam distilation of the sample with Devarda alloy, and the mount of salt retained in the sample corrected by se of the nitrate-nitrogen value. The method is mple and precise, is not subject to obvious errors f many other CEC procedures, and gives results milar to accepted CEC methods involving use of mmonium as the index cation. ADIATION AS A TECHNIQUE IN SOIL IOLOGY AND BIOCHEMISTRY,
alifornia Univ., Davis. Coll. of Agriculture.
. D. McLaren.
oil Biology and Biochemistry, Vol 1, No 1, p 63-3, 1969. 1 tab, 59 ref.

Descriptors: *Soil chemistry, *Irradiation, Soils, Microbiology, Nutrients.
Identifiers: *Soil biology, *Soil biochemistry, terilization.

A review of the utilization of ionizing radiation in oil is presented. Included are observations on the ifferences in sensi tivities of various genera of soil icroorganisms to radiation sterilization and on esidual enzyme activities in sterile soil. As a rule, he larger the microbe the smaller is the minimum ose required. Generally, microorganisms and enymes are killed or inactivated as exponential funcons of dose of radiation, but the dose requirements depend upon the soil t ype, soil moisture and enus of organism. Irradiation induces release of mall amounts of manganese, ammonium, soluble arbon, organic nitrogen, phosphorus, etc. from oil microbes and, to a lesser extent, from humus. The nutrients released can stimulate plant growth n radiation sterilized soil; no toxicity has been oted following soil irradiation. Cells no longer ble to proliferate after irradiation may still be iochemically active, e.g. in respiration and nitrifiation. Irradiated soil is useful for studies of plant-oil-microbe relationships in cases where residues rom chemical sterilizing reagents of toxic products rom steam sterilization treatment are to be voided. ESPONSE OF CHEMOAUTOTROPHIC ITRIFIERS TO FOREST CUTTING,
ale Univ., New Haven, Conn.; and Dartmouth oll., Hanover, N.H.
V. H. Smith, F. H. Bormann, and G. E. Likens.
oil Science, Vol 106, No 6, p 471-473, 1968. 1
ab, 10 ref.

Descriptors: *Nitrogen cycle, *Nitrification, Forest management, Ecosystems, Leaching, Runoff, New Hampshire, Watersheds (Basins), Soil acteria.
Identifiers: *Chemoautotrophs, *Forest cutting, litrosomonas, Nitrobacter, Hubbard Brook Experimental Forest, New Hampshire, Nutrient emoval.

Soils from cutover and undisturbed forest ecosystems in the Hubbard Brook Experimental Forest, New Hampshire, were analyzed for populations of the Nitrosomonas and Nitrobacter groups by the most probably number method. Although the soils in both watersheds were extremely acid (pH 4), they had relatively large populations of Nitrosomonas (9,700-1,850,000 cells/gram). The cutover watershed contained significantly higher numbers of both groups of nitrifiers than did the control watershed. Previous investigations in 1966 had shown that the cutover watershed had a large net release of nitrogen (57 kilograms/hectare) while the control had a net gain of 4.5 kilograms/hectare. The authors felt that the initial increase in chemautotrophic activity was closely related to factors, other than the microclimate, directly correlated with the removal of vegetation. (Keeney-Wis)

2L. Estuaries

A NUMERICAL MODEL OF THE SALINITY DISTRIBUTION IN UPPER CHESAPEAKE BAY,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
William Boicourt.
Chesapeake Bay Inst Tech Rep No 54, May 1969. 59 p, 18 fig, 28 ref, 3 append. ONR Contract No Nonr 4010 (11). Project No NR083-016.

Descriptors: *Estuaries, *Mathematical models, *Salinity, *Flow, Mixing, Diffusion, Turbulence, Water circulation, Currents (Water), Tides, Computer programs, Input-outputanalysis.
Identifiers: *Chesapeake Bay, Susquehanna River.

Upper Chesapeake Bay can be modeled as a one-dimensional estuary to predict the salinity distribution for a given fresh water inflow from the Susquehanna River. The one-dimensionality implies that salinity values are averages taken over the cross section of the estuary and that variables are related only to time and position along a longitudinal axis. The model presented in this study is based on a salt continuity equation in which the seaward salt advection is balanced by turbulent diffusion toward the head of the Bay. Since the interest is in the effects of net non-tidal circulation, the governing equation has been averaged over the tidal cycle. In final form, it is a linear, parabolic partial differential equation with variable coefficients. One years's salinity data were used to determine the functional dependence of the coefficients on the fresh water inflow. The boundary value at the head of the estuary is held fixed, while the seaward boundary value is allowed to vary with time. A separate predictor model relates this value to the flow of the Susquehanna. The computer program listing is included. (Knapp-USGS)

APPRAISAL OF RESEARCH ON DESERT COASTAL ZONES,
Arizona Univ., Tucson; and Army Natick Labs., Mass.
Joseph F. Schreiber, Jr.
IN W.G. McGinnies, B.J. Goldman, and Patricia Paylore, eds., Deserts of the World, an Appraisal of Research into their Physical and Biological Environments, p 647-724, University of Arizona Press, Tucson, 1968. 78 p, 1 fig, 2 tab, 530 ref.

Descriptors: *Deserts, *Coasts, *Synoptic analysis, Arid lands, Arid climates, Semiarid climates, Beach erosion, Beaches, Deltas, Dunes, Geomorphology, Sands, Shore protection, Shoreline cover, Wind erosion, Bibliographies, Coastal marshes, Ocean currents, Swamps, Coastal engineering, Harbors, Intertidal area, Littoral, Surf, Tides, Estuarine environment, Marine geology, Ocean currents, Ocean waves, Oceanography, Gulf.
Identifiers: Australian coastal deserts, Mexican coastal deserts, Peruvian coastal deserts, Chilean coastal deserts, Saudi Arabia, Patagonian coastal deserts, African coastal deserts, Arabian Sea, Persian Gulf, Red Sea.

This study is an inventory and evaluation of literature and research regarding those areas of the Earth where major deserts meet the sea. The following factors are included: nearshore bottom conditions; tides and currents; surf, breakers, and waves; beaches; shore and nearshore erosion and sedimentation; coastal swamps and marshes; and coastal structures and other culture features. An introduction, survey of information available, and review of current research and suggested research is presented for each of the 14 coastal deserts treated. The most important authorities, libraries, data centers and sources of published information are discussed. The evaluation includes discussion of outstanding contributions, significant theories and contributions, nature of the most useful study, model studies and deficiencies in knowledge. It is recommended that an organized, systematic, well-supported research program is essential to achieve the objective of a basic understanding of the physical, biological, and cultural factors, individually and collectively, that combine to give the coastal desert zone its distinctive characteristics. Specific research areas for future work are detailed. (See W69-09206). (Sherbrooke-Ariz)

A NOTE ON THE EFFECT OF DISPERSION ON MEAN CURRENT MEASUREMENTS,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
Akira Okubo.
Chesapeake Bay Inst Tech Rep No 55, June 1969. 14 p, 6 fig, 9 ref, append. AT (30-1) 3109 AEC NYO-3109-44 ONR.

Descriptors: *Estuaries, *Currents (Water), *Current meters, *Statistical methods, *Tracers, Tracking techniques, Dye releases, Diffusion, Turbulence.
Identifiers: Current measuring errors.

The difficulty with drift type current measuring devices is that they move in a random way with respect to the mean current. Thus, when a small number of current followers are used, the values of mean current derived from the observations do not necessarily represent the true values which could be approximated more clearly by a large number of drift devices. In light of the present knowledge of oceanic diffusion, statistical errors associated with current measurement of this type may be estimated. These errors are generally of the order of 1 cm/sec, but may, in some cases, be as large as 10 cm/sec. The statistical problem can be solved partially by the use of tracers; dye tracers have proved to be quite useful in measuring the mean current as

well as in studying diffusion. One must, however, be careful not to interpret the movement of dye patches simply as indicative of the mean current. A knowledge of turbulent diffusion is also needed. (Knapp-USGS)
W69-09252

MAXIMUM ENTROPY MIXING IN ESTUARIES,
Manhattan Coll., Bronx, N.Y.
Dominic M. DiToro.
J Hydraul Div ASCE, Vol 95, No HY4, p 1247-1271, July 1969. 25 p, 8 tab, 37 ref.

Descriptors: *Estuarine environment, *Markov processes, *Entropy, *Salinity, Optimization, Mathematical models, Delaware River, Mixing, Tidal waters, Numerical analysis.

The application of different mathematical models and estuarine theories of maximum entropy mixing for optimum estuarine environment were reviewed. The theory of tidal mixing proposed by Predy formed the basis for the model of maximum entropy mixing which was developed in terms of Markov chains. Three conservation laws which any physically reasonable mixing process must satisfy were related to the properties of a Markov chain The estimate of the appropriate mixing matrix was based on maximum entropy of statistical mechanics and information theory. A numerical technique was employed for solving the resulting simultaneous transcendental equations. A comparison of the equilibrium salinity intrusion data from the Delaware River Model and the theoretical predictions based on the maximum entropy estimate of the mixing process indicated that the theory of entropy mixing is a sound and practical solution to the problem of characterizing the mixing process in an estuary. Identifiers: *USSR, *Methods for water desalination.

The freshwater is unevenly distributed on the earth's surface. Moreover, the geographical distribution of freshwater does not coincide with the present water requirements. The water supply can be improved by redistribution of water resources by more rational utilization and re-use of water and by desalinization of seawater. In the Soviet Union, the water desalinization is very important for the areas of Azerbaijan, Turkmenia, and Kazakstan. The production of freshwater from seawater at a low cost is the most important problem facing the water managers. This paper briefly discusses the advantages and disadvantages of the common desalinization methods. These methods are: Evaporation, freezing, electric ion-exchange, ion-exchange, reverse osmosis, extraction, use of ion-active resins, destruction of the aqueous solution structure, and biological method. The evaporation method is the most widely used for desalinization purposes. All methods used require energy and, therefore, cheap sources of energy is of utmost importance to maintain the cost of the desalinization process as low as possible. The use of atomic power seems to be the best future source of energy for desalinization. (Carstea-USGS)

FUTURE USE OF DESERT SEACOASTS,
Peveril Meigs.
IN W.G. McGinnies and B.J. Goldman, eds., Arid Lands in Perspective, p 101-118, University of Arizona Press, Tucson, 1969. 18 p, 8 fig, 35 ref.

Descriptors: *Forecasting, *Deserts, *Coasts, *Water utilization, Future planning (Projected), Economic prediction, Cloud seeding, Fog, Desalination, Desalination plants, Agriculture, Competting uses, Domestic water, Recreation demand, Groundwater, Arid zones, A rid climates, Hydroponics, Trenches, Water conservation, Water consumption, Water reuse, Cisterns.

The forecast for the next 10 or 20 yr. is that there will be no natural permanent change in rainfall, river flow, or groundwater level, and that men will not by artificial means increase rainfall in desert seacoasts. Desalinated seawater will be used more and more for domestic water supplies and for manufacturing, but not for field farming. Various types of desalination are reviewed as are studies on condensation of fog. Cities and towns will continue to grow more than rural areas; suburbs, dairying, and truck farming will increase just outside the cities. Recreation and retirement facilities will grow, within the sphere of cities and far from cities. Agriculture will grow sporadically in places where men develop groundwater and river water previously unused, and locally, surface water. Hydroponics will be increasingly used where water is expensive. Improved utilization of water resources for agriculture will include groundwater pumping, trench farming, crops with lower water use, water reuse, and deep cisterns. Growth of mining, sea industries, recreation, science and conservation are also expected in desert seacoasts. (See W69-09210). (Sherbrooke-Ariz)

Identifiers: *Water-power-food complex.

This paper reports on a joint project of the University of Sonora and the University of Arizona t o develop an integrated facility for the production of power, water and food for coastal desert areas. A pilot plant was constructed at Puerto Penasco, Mexico. Plans for a solar distribution plant were changed when it was found that almost all coastal communities have waste thermal energy from power plants. The pilot plant utilizes waste thermal energy from the diesel-electric plant that generates the power for the experimental complex. The desalination plant is a 6,000 q./day humidification type distillation unit. 160 deg F seawater is supplied by the power plant, while 78 deg F seawater is taken from a saltwater well. Food production is accomplised in inflated plastic greenhouses, which maintain 100 per cent relative humidity. These units are kept cool by circulation of the air through a seawater spray. During winter months there is a net production of freshwater in the greenhouses due to condensation. Larger units, 64,000 q./day, are presently under evaluation and it is expected that units of this size will be utilized in some ar of the world within the next few years. (See W 09210). LARGE-SCALE TRANSFERS OF WATER AND ALTERNATIVES,
Arizona Univ., Tucson. Water Resources Center.
Sol Resnick.
IN W.G. McGinnies and B.J. Goldman, Eds., Arid Lands in Perspective, p 418-421, University of Arizona Press, Tucson, 1969. 4 p.

Descriptors: *Arizona, *Water conservation, Arid lands, Deserts, Desalination, Water transfers, Interbasin transfer, Import, Reservoir evaporation, Evaporation control, Alcohols, Artificial recharge, Waste water disposal, Water reuse, Surface runoff, Water harvesting, Small watersheds, Sodium chloride, Sewage treatment, Electric power plants, Irrigation-efficiency, Economic feasibility.
Identifiers: Styrofoam.

The author reports on water related research programs at the University of Arizona that pertain to the development of alternatives to large-scale water imports. Evaporation suppression studies concluded that use of long-chain fatty alcohols on less than one-acre ponds was not economically feasible. Use of floating styrofoam rafts was much more encouraging, $65 per acre-foot of water saved (approx. equal costs of large scale water transfers). Experimental use of Tucson Gas and Electric Company's effluent for artificial groundwater recharge is reported on. Two approaches toward increasing the runoff from desert watersheds are being studied. One involves rather limited catchments to provide stock or municipal supplies and includes a storage scheme, while the other is for a much broader treatment of the desert watershed with rock salt. Reuse of waste water is being investigated at the Tucson Sewage Treatment Plant. In Puerto Penasco, Mexico, research has shown that it may be possible to produce electricity, freshwater and food economically as a package unit in arid coastal zones. Other important alternatives studied centered on increasing irrigation efficiencies, which are presently estimated at only 50 per cent. Reasons why large-scale water transfers may become economically feasible in the future and reasons for continuing studies into that feasibility and alternatives to water transfer are outlined. (See W69-09210). (Sherbrooke-Ariz)

AIRBORNE INFRARED RADIOMETER INVESTIGATION OF WATER SURFACE TEMPERATURE WITH AND WITHOUT AN EVAPORATION-RETARDING MONOMELECULAR LAYER,
Colorado State Univ, Fort Collins. Dept. of Atmospheric Science; and Wave Propagation Lab., Boulder, Colo.
R. L. Grossman, B. R. Bean, and W. E. Marlatt.
J Geophys Res, Vol 74, No 10, p 2471-2476, May 15, 1969. 6 p, 5 fig, 2 tab, 6 ref.

Descriptors: *Remote sensing, *Surveys, *Infrared radiation, *Monomolecular films, *Oklahoma, Evaporation, Summer, Instrumentation, Alcohols, Statistical methods, Humidity, Computer programs, Winds, Air-water interfaces, Evaporation control, Water temperature.
Identifiers: *Infrared radiometer measurement, *Lake Hefner, Okla.

Water surface temperature measurements of Lake Hefner, Oklahoma were made August 17-30, 1966 by using an airborne infrared radiometer and the results so obtained were compared with those obtained by a boat radiometer and a floating thermistor. The study shows an average duirnal variation of about 1 deg C for late summer conditions. The lake surface was 0.4 deg to 0.9 deg C cooler than the water about 1 cm below the surface because of cooling by evaporation. Applications of an evaporation-reducing monomolecular film reversed the observed temperature under the monomolecular layer was 0.3 deg C warmer than in the surrounding open water. The comparison of the observations made by the aircraft boat, and floating radiometers shows the reliability of airborn temperature surveys. (Gabriel-USGS)

PREDICTION OF WATER YIELD IN HIGH MOUNTAIN WATERSHEDS BASED ON PHYSIOGRAPHY,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
Robert W. Julian, Vujica Yevjevich, and Hubert J. Morel-Seytoux.
Colo State Univ Hydrol Paper No 22, Aug 1967. 21 p, 9 f ig, 4 tab, 28 ref.

Descriptors: *Rainfall-runoff relationships, *Streamflow forecasting, *Runoff forecasting, *Statistical methods, *Topography, Statistical models, Model studies, Water yield, Water resources development, Weather modification, Colorado River Basin.
Identifiers: *Watershed analysis, Watershed models, Physiography.

A statistical method is presented that permits the estimation of yield of high mountain watersheds in terms of physiographic characteristics evaluated from maps. The method is advantageous because it does not require the knowledge of the climatic or hydrologic characteristics of the basin or of the region. The method is, however, limited to regions of reasonable climatic and hydrologic homogeneity. The applicability of the method is illustrated for several regions in the Upper Colorado River Basin. A coefficient of determination as high as 77% is obtained in the best case. In the worst result the coefficient falls below 50%. The estimate of specific yield is valuable for many applications. It provides, in particular, a means of deciding upon the suitability of basins to weather modification programs. (Knapp-USGS)

PERCEPTION OF CHOICE AND FACTORS AFFECTING INDUSTRIAL WATER SUPPLY DECISIONS IN NORTHEASTERN ILLINOIS,
Chicago Univ., Ill. Dept. of Geography.
Shue Tuck Wong.
Department of Geography Research Paper No 117, University of Chicago, 1969. 93 p, 37 ref, 93 p.

Descriptors: *Decision making, *Water management (Applied), *Industrial use (Water), *Industrial plants, Water supply, Water shortage, Water conservation, Water rates, Water sources, Economic efficiency, Legal aspects, Recirculated water.
Identifiers: Northeastern Illinois Metropolitan Area, Cook County.

Intake of water by similar industrial plants often varies even when conditions of quality and quantity are stable. The purpose of this study is to explore the possible role which perception of the range of adjustments plays in industrial water supply management. The range of adjustments includes: recycling, re-use, elimination of losses, substitution process changes. A decision by an industrial manager as to what adjustments or combination of adjustments to adopt varies, depending on conditions under which the choice is exercised. These may include: (1) Type of industry, (2) age of plant, (3) temporal lapse, (4) size of plant, (5) sources of water supply, (6) experience of a water shortage, (7) price of public water, (8) increase in the cost of water, (9) cost of treatment, (10) need for quality control, (11) rates of repayment investment in conservation equipment, (12) legal restrictions, (13) experience of manager, and (14) sources of information. Through use of questionnaires and analysis of 35 case studies, some patterns of perception and choice of adjustments were found. The conditions under which choice adjustments are exercised, are primarily economic-technologic and partly that of water supply and temporal lapse, all affected by social guides. There was also a correlation between perception and adoption, that is, those managers who perceived became adopters and those who adopt also perceive a wider range of adjustments than those who do not. 04. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control of Water on the Surface

COMMONWEALTH V GORHAM (SUIT TO COMPEL LAND OWNER TO REINSTATE DRAINAGE SYSTEM).

56 Lackawanna Jurist 189-194 (Pa CP 1955).

Descriptors: *Pennsylvania, *Surface drainage, *Highways, *Obstruction to flow, Roads, Surface water, Surface runoff, Natural streams, Watercourses (Legal), Drainage systems, Subsurface drainage, Drainage water, Repulsion (Legal aspects), Pipes, Ditches, Watersheds (Basins), Legal aspects, Judicial decisions.
Identifiers: Injunction (Mandatory).

Defendants bought land across which ran a natural drainage ditch. This ditch had conducted waters, f lowing across and under an adjacent highway, to a creek in the back of defendants' property. In building a home on the property defendants filled in a catch basin and said drainage ditch causing water to collect under and on the other side of the highway. The state sought an injunction to force defendants to replace the drainage ditch so as to allow the drainage of surface waters. In fi nding for the plaintiff the court held that the arbitrary filling in of a ditch, which had carried off the waters of a hi ghway for 60 or 70 years, without providing for proper drainage of the water from the highway, constituted a continuing nuisance which would be restrained and defendants were ordered to provide for such drainage. The court also took note of the fact that proper drainage could have been provided by the installation of a subterranean pipe from the catch basin to any point across defendants' land. (Logan-Fla)

INVESTIGATION OF HIGH AND LOW LEVELS.

NH Rev Stat Ann secs 482:1, 482:2 (1968).

Descriptors: *New Hampshire, *Dams, *Maintenance, *Water levels, Administrative agencies, Administration, Legislation, Water law, Water policy, Legal aspects, Regulation, Water rights, Decision making, Standards, Investigations, On-site investigations, Planning, Evaluation, Hydrolic data, Inspection, Flood control, Public benefits, Public health.

In the interest of public good the water resources board makes such inspections with respect to high or low water levels in the inland public waters of the state and the rights, instrumentalities and practices whereby such levels are affected or controlled which best promote the public health, safety, enjoyment and value of public waters. Records of water flow and the like must be made available to the board after a reasonable request of same so that owners and managers of dams may be advised of the need for variations of run-off and so that they may better plan for and anticipate emergencies. The board calls conferences with dam owners for the purpose of obtaining cooperation in the regulation of stream flow to minimize damage to public and private property at times of high water. Any time the board feels that public health or safety may be jeopardized it recommends action concerning storage or release of water as it deems necessary. (Johnson-Fla)

ARKANSAS POWER AND LIGHT CO. V CAS (OPERATION OF DAMS IN FLOODS).

432 SW 2d 853-861 (Ark 1968).

Descriptors: *Arkansas, *Flood damage, *Floo control, *Reservoir operation, Discharge (Water Judicial decisions, Dams, Floodgates, Watershe management, Water levels, Lakes, Rivers, Floo forecasting, Reservoirs, Weather forecastin Floods, River forecasting, Surface runoff, Crop Electric powerplants, Watercourses (Legal), Leg aspects.
Identifiers: Crops damage, River bottom land Sour crops.

Plaintiffs and other farmers owned land on a ce tain river below two dams owned by defendan Flood waters produced by a sudden rainstorm ove flowed plaintiffs' lands and caused their crops t sour. Plaintiffs claimed that defendant's negligen operation of the dams caused the floodwaters t remain on the land longer than normal causing th souring of the crops. The court held that even if de fendant had been negligent, the evidence did no show that his negligence was the cause of the plain tiffs' damages. The evidence did show that defen dant had discharged water from the dams in such manner as to prevent higher flood levels. Thi method of discharge did cause floodwaters t remain on plaintiff's land longer. However, th court found that there was no evidence to sho that if another method of discharge had been use the crops would not have been destroyed. Th court felt that the crops might have been destroye if water had been left on the crops a much shorte time. The defendant may have been negligent i not using weather forecasts and discharging wate in relation to their predictions, but the court fe this negligence could not be shown to be the caus of plaintiffs' damages. Defendant received directed verdict. (Gadd-Fla)

EDWARD V MASSETT (IMPROVEMENT O STREAM AS DRAINAGE OUTLET).

164 NW 2d 382-386 (Minn 1969).

Descriptors: *Minnesota, *Natural flow, *Drainag systems, *Outlets, Stream flow, Flow, Channels Streams, Riparian land, Riparian rights, Eminen domain, Compensation, Floods, Runoff, Strean erosion, Erosion, Judicial decisions, Drains Damages, Water law, Ditches, Riprap, Legislation
Identifiers: Constitutional law.

Petitioners owned land abutting on a natura stream forming the outlet for numerous drainag ditches. Petitioners claimed the stream was of in sufficient capacity to carry the water from all th ditches and, as a result, caused inundation and ero sion of their land. They brought an action seekin enlargement and deepening of the stream. An en gineer was appointed to make a study. He recom mended two alternative plans to improve th stream. The trial court rejected both plans, one a being ineffective and the other as being too costly Petitioner appealed on constitutional due proces grounds, contending that the flooding and erosio resulted in a taking of land without just compensa tion. The supreme court affirmed holding that sinc petitioners could have objected to the constructio of the ditches on the grounds of the inadequacy o the outlet when the drainage system was bein

tablished, they could not later claim a constitu-
onal right to the improvement. (Helwig-Fla)

PROPAGATION OF THE FLOWS DISCHARGED BY THE 'GHEORGHE GHEORGHIU-DEJ' HYDROELECTRIC PLANT IN THE ARGES RIVER BED (ROMANIAN),
Institute of Hydrotechnical Research, Bucharest (Rumania).
Romeo Amaftiesei, and Gheorghe Popa.
Hidrotechnica, Gosp Apelor, Meteorol, Vol 13, No 5, p 238-243, May 1968. 6 p, 11 fig, 4 ref.

Descriptors: *Discharge measurement, *Hydroelectric plants, *Hydrologic data, Rivers, Infiltration, Seepage, Hydraulic properties, Porosity, Permeability, Gravels, Sands, Bank storage.
Identifiers: *Romania, Arges River flow.

The hydrologic regime of Arges River underwent important changes as a result of discharges from the 'Gheorghe Gheorghiu Dej' hydroelectric plants. Field studies were conducted between July 20-22 and Aug 1-2, 1967 to determine how the discharged water from the plant was propagated in the Arges River. Measurements were made on the evacuation channels of the hydroelectric plants and in 3 additional points along the river course. It was observed that an increase in flow downstream was accompanied by a corresponding reduction in the flow volume. This phenomenon was explained by lateral infiltration of water into the river banks. The variations of water level in observation wells confirmed the above hypothesis. Large amounts of water are stored in highly porous gravels and sands during the high flow. The water flows back into the river when the water level in the river decreases. The amount of water stored in the river banks was calculated by using a mathematical formula in which water level, infiltration coefficient, and active porosity of river banks were used. Wave attenuation was also calculated by using longitudinal and transversal profiles between Oesti and Malu Spart. (Carstea-USGS)

CERTAIN LOCAL PROVISIONS (FORMATION OF DRAINAGE DISTRICTS).

SC Code Ann secs 18-751 thru 18-760 (1962).

Descriptors: *South Carolina, *Drainage, *Drainage districts, *Local governments, Riparian land, Streams, Swamps, Reservoirs, Lakes, Dams, Basins, Canals, Drains, Ditches, Federal government, Construction, Paving, Sewage districts, Cities, Cost sharing, Road construction, Contracts, Administrative agencies, Bridges, Legislation, Obstruction to flow.
Identifiers: Dragline, Counties, Obstruction to drainage, Penalties (Criminal), Competitive bidding, Notice.

Contiguous landowners in Anderson County on a stream on which there is a swamp, may form a drainage district to rid themselves of such swamp. If feasible, they may construct a lake or dam instead of draining such swamp. Any person obstructing drainage in Charleston County is subject to fine or imprisonment. The governing body of Charleston County may cooperate with federal agencies in the construction and paving of drainage and sewer projects in municipalities, if the municipality provides at least half the necessary funds. The governing body of Charleston County shall not enter any contract for drainage work unless sealed competitive bids are first received. A drainage commission is established in Georgetown County which shall have supervision of the county dragline and shall designate the areas of the county to be drained. (Shevin-Fla)
W69-09348

DRAINAGE DISTRICTS UNDER 1920 ACT.

SC Code Ann secs 18-421 thru 18-432, 18-441 thru 18-463 (1962).

Descriptors: *South Carolina, *Drainage districts, *Administrative agencies, *Drainage practices, Jurisdiction, Local governments, Legislation, Water law, Water policy, Legal aspects, Political aspects, Land management, Drainage, Conservation, Land, Land classification, Land development, Land forming, Land reclamation, Flood control, Reclamation, Riparian land, Financing, Assessments, Drainage programs.

Drainage districts may be formed by the State Budget and Control Board or a majority, in numbers or in acreage, of the holders of any contiguous body of swamp, wet or overflowed lands for the purpose of having such lands reclaimed and protected from the effects of water by drainage or otherwise. Before the formation of any drainage district, en election must take place in which a majority of the freeholders of the land which is to be embraced in the district must approve the additional assessment, levy of taxes and issuance of bonds. Also prerequisite to formation of such a district is a petition signed by a majority of the freeholders within the proposed district which must be filed in the appropriate court of common pleas. If objections are overruled and the court finds the proposal to be beneficial to the public health, convenience or welfare, the district is declared a corporation. In a meeting of the local landholders, supervisors for the district are elected and they in turn must appoint a number of administrative personnel including an engineer, a treasurer and overseers. OPTIMAL CONTROL OF A STORAGE RESERVOIR DURING A FLOOD SEASON,
Technion - Israel Inst. of Tech., Haifa.
Oded Levin.
IFAC, Haifa Symp, Comput Contr Nat Resources, Public Util, September 1967. 20 p, 2 fig, 4 ref.

Descriptors: *Optimization, *Control systems, *Flood forecasting, *Reservoir storage, *Overflow, Risks, Markov process, Mathematical models, Water level fluctuations, Transition flow, Water supply.

The study considered the deriving of optimal operating rules for regulating the outflow from a reservoir during a flood in order to minimize water losses due to spills while not exceeding a specified probability that an overflow would occur. A mathematical Markov model was formulated for analyzing the problem. The optimal control functon for the fld season was established and the transition probabilities between each subsequent periods could be computed. Using a Markov chain procedure and proceeding in a chronological order the elements of the seasonal transition probability matrix were computed. The solution provided rules also for continuous control of the outflow from the reservoir as a function of time, water level and any other information concerning the system's state. (Thiuri-Cornell)

THE STATE NAVIGATION SERVITUDE,
Daniel J. Morgan, and David G. Lewis.
Land and Water L Rev, Vol 4, No 2, p 521-538, 1969. 18 p, 85 ref.

Descriptors: *Riparian rights, *Navigable waters, *Condemnation, *Compensation, Legal aspects, Ownership of beds, Easements, State governments, Banks, High water mark, Civil law, Water law, Public benefits, Public rights, Beds under water, Legal aspects, Riparian land.
Identifiers: Navigational servitude.

The state navigation servitude is an exception to the rule that private property cannot be taken by the state without just compensation. The state can limit or take riparian rights of private property owners under this servitude. The theory behind the taking is that the state holds an easement over the navigable waters and their beds for the public to use for navigation. Thus, as long as the taking can be shown to be for the purpose of navigation the state has no obligation to pay compensation. There are three main views of the state navigational servitude. One group of states follows the 'general rule' which allows states to take riparian rights if the taking is to aid navigation. But just compensation is due the riparian owner if the taking is for any other purpose. Another group of states follows the 'public purpose exception to the general rule' which allows the states to extend the no-compensation aspect of the navigation servitude to any government project purposes. The 'Louisiana exception to the general rule' developed from civil law which grants the state an easement to the banks of the upland property owners. The easement includes projects for navigation and extends to such things as levees and roads. (Gadd-Fla)

Authority is granted to the boards of county commissioners to establish public drainage associations for the purpose of draining swampy lands and lands subject to overflow. The commission operates through a board of drainage viewers which, in turn, appoints a board of managers for each improvement project. The title provides for the acquisition of rights-of-way and easements needed to carry out drainage projects, the funding of these projects, and the composition and duties of the boards of drainage viewers and the board of managers for each drainage district. DRAINING LANDS.
Md Ann Code Art 25, secs 87 to 95 (1957).

Descriptors: *Maryland, *Drainage districts, *Drainage programs, *Surface drainage, Land reclamation, Controlled drainage, Drainage engineering, Drainage systems, Local governments, Legislation, Legal aspects, Flood control, Ditches, Canals, Culverts, Construction.

The board of managers of each drainage district may employ laborers and purchase or rent machinery to carry out improvements. The board is charged with maintaining drainage improvements in good repair and may levy a drainage tax for this purpose on the lands benefited. Authorized improvements which would interfere with, or cause removal of, any milldam, or divert water so as to deprive the owner of a milldam of its use, may not be constructed. Obstructing the flow of water through any ditches or other improvements made pursuant to this title is a misdemeanor and is punishable by fine. Where improvements are constructed so as to cross public highways at intersections with natural watercourses, the costs of culverts and bridge enlargements must be borne by the highway authority. Where there is no intersection with a natural watercourse, the drainage association must assume the costs. A majority of the landowners in a public drainage association may petition the board of county commissioners for dissolution of the association. (Kelly-Fla)

DUTIES OF DEPARTMENT OF CHESAPEAKE BAY AFFAIRS.
Md Code Ann art 14B, secs 12-13 (1957), as amended, (Supp 1968).

Descriptors: *Maryland, *Navigation, *Administrative agencies, *Tidal waters, Federal government, State governments, Legislation, Boats, Boating, Harbors, Rivers and Harbors Act, Wastes, Channels, Engineering structures, Dredging, Water districts, Public benefits, Taxes, Regulation, Control, Legal aspects, Cooperation, Water pollution control, Projects, Construction, Financing.
Identifiers: *Chesapeake Bay, *Obstruction of navigation, Towing, US Army Corp of Engineers, Penalties (Civil).

The Department of Chesapeake Bay Affairs is charged with the duty of enforcing any laws applicable to boats using the waters of the state. Its other duties include clearing the waters of logs and other debris which constitute obstructions to navigation and cooperation with federal, state or local agencies which make funds available for its operation. The Department shall tow disabled vessels to the nearest harbor but shall not compete with commercial towing services. It is unlawful for any person to deposit refuse on any waters of the state. The Department shall mark channels in the waters of the state. The Department may establish areas as waterways improvement districts. The Department is to provide liason with the United States Army Corp of Engineers on projects under the Rivers and Harbors Act. It may construct marine facilities beneficial to the boating public. Projects may be financed by special assessments levied against property owners in the district. Any person violating any section of the article is guilty of a misdemeanor. (Shevin-Fla)
W69-09390

DRAINAGE DISTRICT UNDER 1920 ACT.

SC Code Ann secs 18-541 thru 18-579, 18-591 thru 18-599, 18-611 thru 18-616, 18-621 thru 18-638 (1962).

Descriptors: *South Carolina, *Drainage districts, *Drainage systems, *Taxes, Legislation, Drainage, Local governments, Drainage programs, Land, Land tenure, Construction, Construction costs, Assessments, Canals, Ditches, Drains, Boundaries (Property), Watercourses (Legal), Excavation, Bridges, Condemnation, Financing, Operation and maintenance, Bonding, Legal aspects, Administration.

Land within a drainage district shall be taxed proportionately to the benefits it will receive. Delinquent lands may be sold to satisfy the taxes. Bonds may be issued to meet the costs of construction. Funds derived from the sale of such bonds shall be used to pay the cost of the drainage works. A maintenance tax may be levied on land to maintain drains, ditches, or other improvements. Landowners may petition for a readjustment of the tax and a hearing will be held to determine whether such readjustment will take place. The supervisors of the district may petition the court for an order extending its boundaries. Previous drainage systems in the district may be connected with the new system. Any landowner may construct a bridge over any drain, ditch, canal, or excavation. (Shevin-Fla)

DAMS AND DRAINS.
SC Code Ann Secs 18-201 thru 18-205 (1962).

Descriptors: *South Carolina, *Administrative agencies, *Drainage districts, *Regulation, Water law, Water policy, Legal aspects, Legislation, Local governments, Administration, Flood control, Drainage, Multiple-purpose projects, Project purposes, Projects, Reclamation, Surface drainage, Tidal marshes, Public benefits, Public health.

Drainage of swamps, drainage of surface water from agricultural lands and reclamation of tidal marshes are considered public benefits and conducive to the public health. This chapter shall be liberally construed to promote the leveeing, ditching, draining and reclamation of wet overflowed lands. This chapter has no effect on local drainage laws enacted by the General Assembly. The clerk of the court of common pleas keeps the 'Drainage Record' in which every petition, motion, judgment, and order of the board in every drainage transaction which may come before it is recorded. (Johnson-Fla)

TAX DITCHES.
Del Code Ann tit 7, secs 4171-4182 (1953), as amended, (Supp 1966).

Descriptors: *Delaware, *Administrative agencies, *Drainage, *Taxes, Assessments, Administration, Costs, Operating costs, Tax rate, Legislation, Legal aspects, Water law, Financing, Budgeting, Ditches, Drainage districts, Drainage practices, Drainage programs, Maintenance.
Identifiers: *Tax ditches.

The County Board of Assessments keeps a current assessment list in a special assessment book of all

tax ditches formed under this chapter and is assisted by the state drainage engineer in making such appropriate changes in the special ditch assessment books as are warranted by transfers of property located therein. The tax is based on the ratio between the assessment lease for each parcel of property and the total assessment base for the tax ditch. These taxes are collected by the Receiver of Taxes and County Treasurer and are put in separate accounts to be drawn by officers of the respective ditch companies from which the taxes come. Loans may be secured by a tax ditch upon a pledge of the tax warrants from such ditch. Subject to state and county taxes, all taxes levied under this chapter are paramount over other liens on the property taxed. With the consent of the County Soil Conservation District ditch managers may regulate the amount of tax necessary to defray the cost of annual maintenance on such ditches. (Johnson-Fla)

ALLEN V NEW YORK STATE WATER RESOURCES COMM'N (DAMAGE FROM DAM CONSTRUCTION).

299 NYS 2d 586-589 (1969).

Descriptors: *New York, *Dam construction, *Administrative agencies, *Competing uses, Property values, Public rights, Jurisdiction, Damages, Legislation, Water law, Legal aspects, Water policy, Project purposes, Riparian rights, Water rights, Artificial use, Civil law, Relative rights, Riparian waters, Riparian land, Regulation, Public health.

Petitioners brought suit in the Albany Supreme Court to obtain a judgment annuling the determination of respondent Water Resources Commission that a dam might be constructed on the Cayuta Lake Outlet. Petitioners alleged that private damages would follow which would diminish the value of their lands. Under conservation law regulations the Commission must determine whether such construction is contrary to the public interest and whether it would endanger the public health, safety and welfare or the state's natural resources. The Commission made the determination that the public requirements were met, but did not determine the relative merits of t he private interests involved. Pursuant to their finding the Commission did not establish a lake level or mandate the construction of a dam but merely found that no public interest would be violated by a dam with a crest not above a certain elevation. The court held in affirming the Commission's finding that, while there is still recourse through the courts for private injuries, the Commission's finding that the project was not contrary to public interest was within the scope of its authority. The proceeding was dismissed. (Johnson-Fla)
W69-09399

GRATHWOHL V HIWAY WONDERLAND INC (FLOOD DAMAGE FROM LOWER RIPARIAN DAM).
298 NYS 2d 1020-1021 (NY App Div 1969).

Descriptors: *New York, *Dams, *Riparian rights, *Remedies, Relative rights, Judicial decisions, Legal aspects, Riparian land, Flood control, Damages, Backwater, Evaluation, Value, Property values, Operation and maintenance, Water levels, Flood damage, Flooding, Land tenure.
Identifiers: *Injunction, Trespass.

Upper riparian owners sought injunctive relief to prevent flooding by a dam constructed by the lower riparian owners. The trial court found evidence that the dam was causing the flooding. It therefore enjoined the defendants from closing the port holes or raising the existing height of the dam. The court further held it could not award damages since the plaintiffs offered no proof of valuation or the cost of restoration. The plaintiffs appealed for further relief to enjoin the defendants from maintaining the dam higher than the stream bed where the stream left the plaintiffs' property. Sustaining the factual findings in the record, the appellate court modified the judgment in providing that the plaintiffs could seek additional relief for further substantial injury at the foot of the judgment or could bring separate actions for any subsequent injury. The court found the defendants were continuing to commit a technical trespass. (Breeze-Fla)

BATTJES BUILDERS V BOUMA (COUNTY DRAIN PROJECT).

167 NW 2d 123-126 (Ct App Mich 1969).

Descriptors: *Michigan, *Drainage, *Public health, *Administrative agencies, Judicial decisions, Assessments, Flood protection, Natural streams, Local governments, Construction, Taxes, Administrative decisions, Adjudication procedure.
Identifiers: Whiskey Creek drain, Drain Commission, Injunctions (Prohibitory).

Plaintiffs sought to enjoin defendant drain commission from constructing a county drain. Plaintiffs contended that the drain, in benefiting only one party, would not be conducive to the public health, welfare and convenience as required by the drain code. The court found that the drain would serve plaintiffs as well as others. This was held to be sufficient to satisfy the drain code requirement. Plaintiffs' second contention was that defendant commission should have established a new drain instead of improving an existing drain which was a natural watercourse. The court found that a natural watercourse was included in the statutes defining drains. Also, the court found that the legislature had intended the improvement of natural watercourses to be within the drain code. The court stated that the drain commission could contract with a private person for the construction of drain facilities part of the consideration for which would be the relief of assessments made upon the private person. ifiers: Surface water control.

interest of public health, safety and welfare e water protection districts may be formed to litches, channels, sewers, dams and other sary construction to protect against injury to nd property due to damage by surface water. To be qualified to become a district the territory must be a contiguous area, not in more than two counties, so situated that establishment of facilities will conduce promotion and protection of public health and safety from damage due to surface water and so situated that the territory is not within the jurisdiction of another district. When fifty or more legal voters of a proposed district petition the circuit court for the establishment of a district such court shall hold a hearing in which residents of the proposed district may appear and be heard. Upon approval of the petition by said court, an election takes place which is supervised by the court and in which a majority of affirmative votes cast is necessary to establish a district. A petition by all the owners of land within a proposed district for an order incorporating a district may be made in lieu of the election procedure outlined previously. (Johnson-Fla)
W69-09429

SURFACE WATER PROTECTION DISTRICTS.

Ill Ann Stat ch 42, secs 452 thru 459 (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Illinois, *Surface waters, *Administrative agencies, *Jurisdiction, Legal aspects, Water law, Administration, Adjudication procedure, Regulation, Decision making.

All courts must take judicial notice of the existence of surface water protection districts. Such districts constitute a body corporate which may sue or be sued. After a petition by one per cent of the legal voters in a proposed addition to a district and a public hearing before the circuit court, an election is held in which the new area is added to the existing district on the majority vote of those participating in the election. The appropriate county court appoints five trustees who compose the governing board for the district and whose terms are generally five years. Board members and employees of the board are prohibited from having financial interests in the activities, contracts, and work of the district, but are not prohibited from owning land which is taxed for purposes of the district. The court which made the original appointment fills subsequent vacancies on the board. The members of the board of trustees may be compensated up to $250 per annum and have the power to pass all necessary ordinances, rules and regulations for proper management and conduct of the district's business. (Johnson-Fla)

Partial or total application of the methods will provide much of the data necessary for making current management decisions as to the best way of meeting future water demands. Not only can a few arbitrarily selected operational plans be compared by its use, but the tools are also provided whereby an optimum plan can be derived by the local water agency. The economic impact of various legal and political constraints on the optimum plan can also be evaluated. Because this method is written in general terms and preserved in computer programs, it permits rapid updating and adjustment of operating criteria as conditions change, as more geologic and hydrologic information becomes available, and as experience is gained in actual operations. HYDROGEOLOGICAL STUDIES FOR DRINKING WATER SUPPLY OF CRAIOVA CITY (ROMANIAN),
Gheorghe P. Constantinescu.
Hidrotehnica, Gosp Cipelor, Meteorol, Vol 13, No 3, p 123-141, Mar 1968. 19 p, 9 fig, 7 tab, 23 ref.

Descriptors: *Water resources development, *Hydrogeology, *Water supply, Geomorphology, Potable water, Aquifers, Springs, Quaternary period, Observation wells, Analytical techniques, Water properties, Watershed management, Rivers.
Identifiers: *Romania, Craiova water supply, Jiu River.

The geology and hydrogeological conditions of the Jiu River basin are described as they relate to the water needs of the rapidly growing industrial city of Craiova, Romania. A comprehensive study was made that included measurements of springs and rivers, estimating seepage and underflow, drilling and experimentally pumping of test wells, analyzing selected water samples, and mapping of geologic units. Sands and gravels in Quaternary and Pliocene formations contain the only available groundwater which, however, is generally insufficient and of such inferior quality that it will not meet the needs of the city and surrounding area. The needs total 1.77 cu m/sec. Alternatives were considered that led to the conclusion that a dual water source would be necessary: (1) utilizing the underflow of the Jiu River floodplain and (2) development of the Karstic springs in the Vilcan Mountains. Quality of the Izuarna-Coetenigroup of springs is among the best in Romania. Water from the two sources will furnish Craiova City until 1985. (Lang-USGS)

Plaintiff brought this suit against defendant co to recover damages to his crops caused by over of water resulting from improper construction road. Plaintiff charged defendant with the negli and wrongful acts of filling up an existing drai canal and the construction of a road bed upon fill. Plaintiff alleged that defendant placed cul under this road which were inadequate to carry normal flow of water. The issue raised before court was whether the county had jurisdictio the road. If it did have jurisdiction, it woul responsible for the alleged damages caused. question arose since the state highway departm provided a survey of the road and other aid i construction, while the federal government

led plans and man power through the WPA. The urt held though, in that all work was done with unty permission, the county had jurisdiction of e road and would be liable for all crop damage sulting from negligent construction of this road. ogan-Fla)

ntifiers: *Tort liability, *Foundations, Actual tice, Implied notice.

aintiffs sought damages for water damage to their rchandise allegedly caused by defendant water mpany's negligence in allowing one of its water ins to break. Seven other breaks had occurred in fendant's pipes at the downtown intersection in estion. Defendant's superintendent testified that e company was aware of the terrible condition of wers below the pipes, which might affect the undation under the pipes. On the evidence, the y awarded pl aintiffs $7,834.69 damages. On ap-al by defendant, the court of appeals of Ken-cky held plaintiff did not have the burden of oving a defect in the particular section of pipe ich broke. The court felt the evidence sufficient go to the jury where previous breaks and owledge of conditions might reasonably have put fendant on notice of possible future breaks if no medial precautions were taken. ATERSHED CONSERVATION DISTRICTS.
Code Ann, secs 63-171 thru 63-191 (Supp 68).

scriptors: *South Carolina, *Watersheds asins), *Water conservation, *Administrative ncies, Project planning, Water resources velopment, Water utilization, Water districts, gislation, Soil conservation, Soil erosion, Flood protection, Disposal, Land tenure, Soil management, State governments, Financing, Programs.
Identifiers: Water conservation districts.

Watershed conservation districts may be established as herein provided within one or more soil and water conservation districts for the purpose of developing and executing plans and programs relating to any phase of the control and prevention of soil erosion or flood prevention, the conservation, development and utilization of soil and water resources and the disposal of water. This authority is applicable to, but not limited to, the planning and carrying out of works of improvement for the above purposes. Certain procedures shall be followed in setting up the district. The procedures include petitioning by landowners to set up the district. Supervisors shall be appointed and a referendum held on the establishment of the district. The governing body shall consist of five directors elected as provided herein. The district shall be a governmental subdivision of the state and shall exercise public powers as provided herein. The district may issue bonds and levy taxes for payment thereof. Procedures are set up for collecting taxes, annexing lands, and discontinuing the district. (Heckerling-Fla)

REVEGETATION PROCEDURES FOR IMPROVEMENT OF THE SAN SIMON WATERSHEDS,
Arizona Univ., Tucson. Dept. of Watershed Management.
Gilbert L. Jordan.
Internat'l Conf. on Arid Lands in a Changing World, Arizona Univ., Tucson, June 3-13, 1969. 3 tab, 8 p.

Descriptors: *Watershed management, *Revegetation, Arizona, Arid lands, Arid climates, Yield, Sheetflow surface runoff, Valleys, Drought resistance, Alteration of flow, Brush control, Erosion control, Habitat improvement, Plant groupings, Deserts, Soil moisture, Deep tillage, Range management, Vegetation regrowth, Grasses, Ranges.
Identifiers: San Simon Valley (Ariz), Lehmann Lovegrass.

The San Simon Valley of southeastern Arizona is a frail watershed subject to excessive erosion and channel development. More than half of the annual precipitation of 9.5 in. occurs as torrential thunderstorms during the summer. Present cover consists of various communities of Sonoran and Chihuahuan desert shrubs. Shrubs frequently outcompete grasses for the limited soil moisture, exposing areas of bare soil. The first requirement for revegetation was adequate shrub removal; several methods were evaluated: Chained or bull dozer-cleared areas of creosotebush attained 75% of original growth in 4 yr. (sand dune mesquite 75% in 2 yr.). June was more effective than March for chaining. Adequate brush control could be had only by root plowing or disk plowing. Attention was also given to concurrent seedbed preparation and modification, type of seedbed, time of seeding and method of seeding. With Lehmann lovegrass, broadcasting has been as effective a means of planting as drilling. March seeding was much more successful than June in 1968, while in other years there was little difference. Disk plowing was constantly better than root plowing and both were better than chained and pitted seedbeds. Of several other species of Eragrostis studied, the most promising was Boer lovegrass E. curvula var. conferta. Substantial increases in yield were obtained from pitting of plowed seedbeds. Forage yields of 800-1500 lbs/acre were achieved on the better sites, along with runoff prevention. (Sherbrooke-Ariz)

5A. Identification of Pollutants

RAPID PHOSPHATE DETERMINATION BY FLUORIMETRY,
Missouri Univ., Columbia. Dept. of Chemistry; and Oak Ridge National Lab., Tenn. Div. of Analytical Chemistry.
John C. Guyon, and Wilbur D. Shults.
J Amer Water Works Ass, Vol 61, No 8, p 403-404, Aug 1969. 2 p, 3 fig, 3 ref.

Descriptors: *Analytical techniques, Chemical analysis, *Phosphates, *Fluorometry, Pollutant identification, Water chemistry, Water quality.
Identifiers: Phosphate analysis.

To measure phosphate contamination, two similar fluorometric procedures are offered, one for low concentrations and one for high. The methods proposed were evaluated by adding known amounts of phosphate to volumetric flasks and carrying out the analysis as described in the recommended procedures. An average relative error of 1-5% was observed for the one system, and 2% for the other. These suggested methods provide survey techniques for phosphate determinations over a wide range of concentrations. The methods are manipulatively simple, and should be readily adaptable to field survey or to conventional or automated laboratory situations. (Knapp-USGS)

Proc Amer Chem Soc Symp on Water, Air, and Waste Chem, Apr 13-18, 1969, Minneapolis, Minn, 1969. 41 p, 12 fig, 2 tab, 22 ref, 1 append.

Descriptors: *Sewage treatment, *Monitoring, *Sampling, *Measurement, *Instrumentation, Research and development, Mathematical models, Control systems, Activated sludge, Anaerobic digestion, Biological treatment.
Identifiers: Sewage treatment monitoring.

Available and experimental instruments for monitoring activated sludge and anaerobic sewage treatment processes are surveyed. The main difficulty encountered with most instruments is fouling of the sensor process lines and other equipment in contact with the samples. This fouling is primarily caused by grease and solid accumulations which result in excessive maintenance and recalibration. These problems in many instances can be minimized by homogenization of the sample stream before analysis and making provisions for automatic flushing of the instrument. Instruments to measure pH, temperature, dissolved oxygen and sludge level have been satisfactorily applied on a continuous basis. The Chicago Metropolitan Sanitary District is presently employing temperature, dissolved oxygen and sludge level detection instruments to automatically control some aspects of biological treatment. In addition, treatment plants can be operated with the aid of advanced computer techniques in conjunction with improved mathematical models that accurately describe the behavior of these processes. This type of advanced system could also have instant readout of the operating and analytical parameters and a memory bank capable of storing historical data for process investigation. (Knapp-USGS)

A RAPID METHOD FOR ESTIMATING RADIUM AND RADON IN WATER,
Bhabha Atomic Research Centre, Bombay (India). Air Monitoring Section.
D. N. Kelkar, and P. V. Joshi.
Health Physics, Vol 17, p 253-257, 1969. 5 fig, 2 tab, 4 ref.

Descriptors: *Radium radioisotopes, *Estimating, Temperature, Hydrogen ion concentration, Thermal springs, Radioactivit y, Groundwater, Lead radioisotopes, Sampling.
Identifiers: *Radon, Zinc sulfide scintillation powder, Barium, India, Bombay, Concentrations, Alpha activity, Bismuth, Polonium, Photomultiplier scaler, Thickness.

A rapid method for estimating radium and radon in water samples with activity levels more than 1-2 picocuries per liter, is described. Radium and daughter products of radon are precipitated with more than 95% efficiency in the presence of zinc sulfide (silver) scintillation powder giving a composite scintillator-sample combination. Apart from being rapid and inexpensive, the method is suitable for field use as it requires little apparatus and does not involve laborious chemical analysis. It is based on the co-precipitation of radium, and lead, bismuth and polonium with barium (as carrier) in the presence of zinc sulfide (silver) powder. Effects of temperature, hydrogen ion concentration, and amount of zinc sulfide (silver) were studied and conditions for optimum yield were determined experimentally. Excessive thickness of the sample affected counting. The overall eff iciency of the method, including geometry, is 68%; other conventional methods (excluding the emanation method) is seldom more than 45-48%. This method, though less sensitive than the more conventional methods, is quick, inexpensive and gives fairly good accuracy. Results of radium and radon levels in thermal springs measured in the field using this method, are tabulated. (Jones-Wis)

5B. Sources of Pollution

COOLING POND DESIGN IN THE SOUTHWEST,
Ebasco Services, Inc., New York.
T. J. Cotter, and A. W. Lotz.
Journal of the Power Division, Proceedings of the ASCE, Vol 87, No PO2, p 85-103, July 1961. 17 p, 13 fig, 1 tab.

Descriptors: *Thermal pollution, *Water conservation, *Engineering structures, *Cooling towers, Water resources, Non-consumptive use, Topography, Hydrologic data, Intake gates, Water discharge, Wells.
Identifiers: *Southwest, *Cholla Plant, *Four Corners Plant, Cooling pond design, 'Hot pond' concept.

The use of cooling ponds as a source of circulating water for central steam-electric stations is (in 1961) steadily increasing in the United States. The pond design for greatest effi ciency in heat dissipation must consider pond depth, intake depth, separation of intake and discharge, and make-up water supply. Although formulae and heat balances have been developed, judgment factors based on experience with varying physical characteristics under different climatological conditions are more critical in the design. These considerations are discussed in detail with reference to ponds at the Cholla and the Four Corners Plants in New Mexico. (Sherman-Vanderbilt)

PREDICTION OF TEMPERATURE IN RIVE AND RESERVOIRS,
California Univ., Berkeley. Civil Engineering De
Jerome M. Raphael.
Journal of the Power Division, Proceedings of t ASCE, Vol 88, No PO2, p 157-181, July 1962. p, 8 fig, 6 tab.

Descriptors: *Water pollution effects, *Tempe ture control, *Climatological data, *Ener Budget, Thermal pollution, Heat balance, Te perature distribution, Heat transfer, Solar rad tion, Thermocline, Evaporation.
Identifiers: *Temperature prediction, Short wa radiation, Back radiation, Lake Hefner.

A procedure is presented for predicting the te perature of various water bodies from weat records, inflow and outflow characteristics, and t surface area and volume of the body of water. T method can be applied to shallow lakes, flowi streams, and detention reservoirs, in which t thermocline is absent and the water is so stirred wind or current that temperatures are uniform. T heat-flow problem is reviewed and the essent equations are derived. An evaluation is made of t effect of atmospheric conditions such as air te perature, relative humidity, cloud cover, wi speed, and barometric pressure on short-wave i solation and reflectance, long-wave radiation fr atmosphere and water, evaporation, conductio and advection. Sources of climatological data a examined. A numerical procedure is described which all these effects are combined for a sh time increment and a complete heat balance o tained yielding the temperature change of the bo of water during the interval. An example is given the use of the method, which is easily adaptable machine computation. The method should find a plication in the comparison of temperature streams with and without detention reservoirs a in the dissipation of heat from industrial sources streams and lakes. (Sherman-Vanderbilt)

THERMAL POLLUTION OF WATE SYSTEMS,
Rutgers - The State Univ., New Brunswick, N.J.
Burton Davidson, and Robert W. Bradshaw.
Environmental Science and Technology, Vol 1, N 8, p 618-630, Aug 1967. 13 p, 8 fig, 14 ref.

Descriptors: *Thermal pollution, *Simulation an ysis, *Dissolved oxygen, *Biochemical oxygen d mand, *Water resources development, *Optimiz tion, Mathematical models, Temperature contr Analog models, Hydrologic data, Water pollut sources.
Identifiers: Enthalpy balance, Temperature index

The temperature pollution index to be establish must satisfy both law enforcement agencies a water users. Literature on thermal pollution reviewed and related t o a mathematical simulat model of BOD and DO content. The DO factor used to derive an optimal temperature in a pollut stream through a series of pollution-purificati balance equations. These analyses have be restricted to slowly-moving, medium-sized strea under summer conditions with idealized plug fl velocity. The optimization problems have three el ments: continuous, deterministic performan equations (BOD-DO equation) and initial or bou dary conditions; a piece wise continuous decisi vector function and constraints (stream temper ture, 0 deg C to 60 deg C; an objective functi (maximization of stream DO). Temperatu profiles are presented in the paper. (Sherman-Va derbilt).

THE AVAILABILITY OF GROUNDWATER FOR COOLING PURPOSES (DUTCH),
Rijksinstituut voor Drinkwatervoorziening, Delft (Netherlands).
J. C. van Dam.
De Ingenieur, Algemeen Gedeelte 51, Jrg 80, p A743-A749, Dec 20, 1968. 7 p, 1 fig, 5 tab, 6 ref.

Descriptors: *Thermal pollution, *Applied water management, *Groundwater, *Water resources development, *Water discharge, *Water utilization, Natural recharge, Sludge disposal, Groundwater movement.
Identifiers: Netherlands.

The paper deals with conditions in the Netherlands. After a review of the occurrence of fresh, saline and brackish groundwater, information is given on the natural recharge and the safe yield of the fresh groundwater. The future water requirements for population and industry are far in excess of the safe yield of the fresh groundwater. Therefore, in general, fresh groundwater should not be withdrawn for cooling purposes exclusively, unless it is returned into the underground after use. Abstraction of saline and brackish groundwater generally does not meet with hydrological difficulties, however disposal of this water in fresh surface-water is unacceptable. THEREFORE AFTER USE IT SHOULD EITHER BE DISCHARGED INTO THE SEA, BY PIPELINE, OR BE RETURNED INTO THE UNDERGROUND. Finally some considerations are given on the increase of the groundwater temperatures in case warmed-up water is returned into the underground. Higher temperatures stand in the way of other abstractions for cooling. The final groundwater temperatures are reached after several years only. (Sherman-Vanderbilt)
W69-09048

THE RAPID THERMAL DIFFUSION OF STEAM STATION COOLING WATER DISCHARGE INTO RESERVOIRS,
Duke Power Co., Charlotte, N.C. Environmental Research.
J. Ben Stephenson.
Proceedings - Sixteenth Southern Water Resources and Pollution Control Conference, p 98-108, 1967. 11 p, 11 fig.

Descriptors: *Thermal pollution, *Water pollution effects, *Water chemistry, *Water treatment, *Temperature control, *Cooling water, Electric power plants, Thermal stratification, Dissolved oxygen, Water resources development, Limnology, Heat flow.
Identifiers: Thermal stability, Thermal behavior, Marshall Steam Station, Thermal diffusion.

The effect of temperature on other aquatic environmental factors is investigated, the dissolved oxygen content in particular, and related to water resources research and development (Marshall Steam Plant). Data from continuous testing (successive stations in a canal) of thermally stratified and thermally stable conditions of the reservoir is given in figures which relate temperature effects to dissolved oxygen content. One benefit found was that normally stagnant water from the bottom of the reservoir becomes exposed to the atmosphere and absorbed more oxygen. The lake observations of the discharging process indicate that water quality and other ecological factors are not impaired by the cooling waters. Generally, the temperature effects are limited because the discharged heat is rapidly diffused in the lake. Improved fishing conditions is one of the actual benefits which is cited. THE EFFECT OF CATION EXCHANGE CAPACITY ON THE RETENTION OF DIQUAT AND PARAQUAT BY THREE-LAYER TYPE CLAY MINERALS: 1. ADSORPTION AND RELEASE,
North Carolina State Univ., Raleigh. Dept. of Soil Science.
S. B. Weed, and J. B. Webber.
Soil Sci Soc Amer Proc, Vol 33, No 3, p 379-382, May-Jun 1969. 4 p, 4 fig, 2 tab, 11 ref.

Descriptors: *Adsorption, *Herbicides, *Clay minerals, Soil chemical properties, Organic compounds, Montmorillonite, Magnesium, Potassium, Calcium, Ion exchange, Diquat, Paraquat, Path of pollutants.
Identifiers: Vermiculite.

Diquat and paraquat were equilibrated for thirty minutes with suspensions of three-layer clay minerals varying in CEC from about 1 to 1.6 meq/g. Maximum adsorption of the divalent organic cations, expressed as % of CEC, decreased from 100% for montmorillonite (CEC= 1.03 meq/g) to 13% for a K -depleted muscovite (CEC= 1.63 meq/g). The exchangeable inorganic cation initially present markedly affected adsorption of diquat and paraquat by vermiculite but had much less effect on adsorption by montmorillonite. The order of adsorption was Na -vermiculite is greater than Ca -vermiculite is greater than or equal to Mg -vermiculite. Less than 15% of the adsorbed diquat or paraquat was released from montmorillonite by a single equilibration with approximately five symmetry of 0.005N chloride salt solutions of Al, Ca, Mg, or K. Similar treatment of vermiculite released up to 70% of the adsorbed organic cation, the order of release being from largest to smallest, Al, Ca, Al, for paraquat. Three successive treatments of vermiculite released up to 89% of the diquat or paraquat. (Knapp-USGS)

WARM-WATER IRRIGATION: AN ANSWER TO THERMAL POLLUTION,
SCIENCE, Washington, D.C.
Luther J. Carter.
Science, Vol 165, No 3892, p 478-480, Aug 1, 1969.

Descriptors: *Thermal pollution, *Nuclear power plants, *Waste-water disposal, Irrigation water, Public utilities, Nuclear wastes, Water utilization.
Identifiers: *Oregon, *Willamette Valley, Heated soil.

Two utility-financed projects for the agricultural use of heated waste-water are operating in Oregon. The warm-water discharge enhances plant growth and protects fruit trees from frost on a 170-acre tract (Willamette Valley) where plans are being made to experiment with an underground warm-water pipeline. A simulation has begun and been successful in the growth of corn on a 2-acre plot (Oregon State University). The utility investment in the farm was $475,000. A $2.6 million project has been drafted by the AEC but is not yet funded. Warm-water irrigation plans are appropriate in the Northwest because: (1) There are many acres of irrigable land; (2) There are many valuable fisheries in the rivers and restriction on river water use; (3) Tower and lake construction is expensive and unsightly compared to agricultural proposals. The findings are encouraging although limited and inconclusive. Professors at the University of Oregon warn that warm-water irrigation does not use the constant supply of effluent water, that it could be a health hazard, and presents research problems best handled by a university. (Sherman-Vanderbilt)
W69-09301

TEMPERATURE ANALYSIS OF A STREAM,
M. R. Collings.
Geological Survey Research, p 174-179, 1969. 5 fig, 2 tab, 6 ref.

Descriptors: *Temperature, *Streams, Meteorological effects, Water quality, Fourier analysis, Aquatic environment.
Identifiers: Chehalis River, Spot Water-temperature data, Hatcheries, Monthly maximum temperatures.

Temperatures of a stream were fitted and defined by a harmonic analysis of the probable occurrence, at the 95-percent level, of maximum and minimum monthly temperatures and of median temperatures throughout the year. The 0.5-probability curve of maximum temperatures was found to have equivalent values of amplitude and phase angle to that of a curve fitting 9 years of monthly maximum temperatures. Investigations also were made to determine the acceptability of using spot-temperatures throughout the year. A comparison, by regression analysis, of the mean monthly temperatures, from the thermograph record, with the synthetically determined median monthly temperatures, from the spot measurements, showed a standard error of 1.6 deg C. Another comparison, between the average harmonic curve from 4 years of spot measurements and the median curve from the maximum and minimum monthly temperatures, showed a standard error of 0.9 deg C. (Ross-Vanderbilt)

DIFFUSION OF COOLING WATER DISCHARGE FROM MARSHALL STEAM STATION INTO LAKE NORMAN,
Duke Power Co., Charlotte, N.C.
R. Fred Gray, and J. Ben Stephenson.
ASCE National Meeting on Environmental Engineering, Power Division, Chattanooga, Tennessee, p 1-21, May 13-17, 1968. 12 fig, 1 tab.

Descriptors: *Cooling water, *Thermal pollution, *Thermal stratification, *Environmental effects, *Synoptic analysis, Meteorological data, Reservoir, Water discharge, Isotherms.
Identifiers: *Marshall Steam Station, *Lake Norman, Skimmer wall.

This article reports data and conclusions of field research on heat dissipation patterns at the Marshall Steam Station on Lake Norman. If temperature data and meteorological factors are known, then the cooling water diffusion can be monitored. The field site is described for which two units of 350 mw each operate. Special features in the dissipation process are a submerged skimmer weir and an inverted skimmer wall. Temperature profiles (several are shown) from the synoptic survey are representative of different seasons and meteorological conditions and show that distinct advantages result from the location on a large reservoir where bottom water can be used for condenser cooling. During the colder months, the heated water rises to the surface where it is cooled by air and wind, while in summer months, the use of cold bottom water for cooling results in discharge temperatures close to lake-surface water. Only a small part of the lakes cooling capacity is needed. A comprehensive three year study of biological conditions is planned. (Sherman-Vanderbilt)

MOVEMENT OF FALL-APPLIED NITROGEN IN SANDY SOIL,
Forest Research Lab., Maple (Ontario).
H. H. Krause, and W. Batsch.
Can J Soil Sci, Vol 48, p 363-365, Oct 1968. 1 fig, 8 ref.

Descriptors: *Nitrogen, *Leaching, Nitrates, Nitrification, Eutrophication, Cycling nutrients, Soils, Water pollution sources.
Identifiers: *Fall-applied fertilizer-nitrogen, *Sandy soil, Groundwater pollution.

A lysimeter experiment on a sandy soil indicated significant nitrification and leaching of added ammonium fertilizer occurring from September 20 to November 30. About 88% of the added fertilizer-nitrogen (112 kilograms/hectare of nitrogen as ammonium nitrate) was lost. Soil temperatures during the experiment were far below optimum for nitrification, and during the last half of the experiment, the soil froze repeatedly to depth of 5 centimeters. The results obtained indicated that fall applied fertilizer-nitrogen would be lost to the succeeding crop. (Keeney-Wis)

5C. Effects of Pollution

THERMAL REQUIREMENTS OF FISH - THREE DECADES OF STUDY, 1940-1970,
Fisheries Research Board, Nanaimo (British Columbia). Biological Station.
J. R. Brett.
Transactions of the Second Seminar on Biological Problems in Water Pollution, Robert A. Taft Sanitary Eng Center, p 110-117, 1959. 8 p, 5 fig, 33 ref.

Descriptors: *Temperature control, Acclimatization, Metabolism, Biology, Water supply, Aquatic environment, Thermal pollution.
Identifiers: Homeotherms, Environmental factors, Lipid structure.

Three decades of research (1940 to 1970) on temperature relations in fish, and cold-blooded animals generally, are discussed. Speculation on the trends in the next decade are made from a survey of current literature. Temperature acts in a variety of ways. It may kill, reduce activity, interact with other environmental factors, confine reproduction, and be a directing agent where a gradient exists. Differences between species in maximum temperature tolerance can be as great as 17 deg C (31 deg F), and, in overall tolerance, a difference factor of 2.7 times can separate the most tolerant from the least tolerant. Despite ability to withstand low temperatures, slow rates of acclimation appear to result in greater mortalities from cold in nature. Temperature controls the activities of fish by regulating rates of metabolism (resting and active). The numbing effects of low temperature restricting performance, or the equally restricting effects of high temperature demanding excessive body maintenance are of serious consequence for maintaining continuity of a species. Research on this aspect and the information made available is required if adequate thermal relations are to be prescribed for fish: In order to prescribe thermal requirements, limits to the 'safe' reduction of activity imposed by temperature are set forth as a basis for discussion. SWIMMING PERFORMANCE OF SOCKEYE SALMON (ONCORHYNCHUS NERKA) IN RELATION TO FATIGUE TIME AND TEMPERATURE,
Fisheries Research Board, Nanaimo (British Columbia). Biological Station.
J. R. Brett.
Journal of Fisheries Research Board of Canada, Vol 24, No 8, p 1731-1741, Aug, 1967. 11 p, 4 fig, 2 tab, 17 ref.

Descriptors: *Sockeye salmon, *Thermal pollution, Fresh-water fish, Metabolism, Temperature, Acclimatization, Aquatic environment.
Identifiers: *Swimming performance of fish, Fixed velocity effects, Temperature effects, Lethal temperatures, Fatigue testing.

Further studies on the swimming performance of fingerling sockeye salmon at fixed velocities have been conducted in relation to fatigue time. The method of probit analysis, commonly used in dealing with bioassay data, was found to be suitable for determining times to 50% fatigue and in providing a measure of variance despite the presence of some erratic behavior. For sockeye acclimated to 15 deg C (mean length= 13.6 cm) the velocity at which 50% fatigued was 54.4 cm/sec or 4.0 lengths/sec (L/sec). The 5% and 95% fatigue velocities were 3.1 and 4.8 L/sec, respectively. Larger fish required longer exposure times for determining maximum sustained speeds, extending from approximately 120 min for fingerlings to 500 min for adults. Using the method of increasing velocity steps the effect of temperatures from 5 to 27.5 C was examined. When acclimated to 15 C fingerling sockeye exhibited only a 4% reduction in swimming speed at 10 and 20 C. Temperatures above the lethal level caused a rapid decline in swimming ability approaching the extinction point at 27.5 C. Recommendations for standard procedures in the study of swimming speeds are made. (Ross-Vanderbilt)

RESEARCH ON TEMPERATURE EFFECTS O FISHES,
Federal Water Pollution Control Administratio
Duluth, Minn. Nat ional Water Quality Lab.
Donald I. Mount.
Paper presented at the Eighth Annual Environme
tal and Water Resources Engineering Conferen
Vanderbilt Univ, p 1-14, June 5-6, 1969. 14 p.

Descriptors: *Thermal pollution, *Temperatu
control, *Environmental effects, *Water qual
control, Aquatic environment, Regional analys
Thermal stratification, Commercial fish, Sport fis
Food chai ns.
Identifiers: *National Water Quality Laborato
Yellow perch, White suckers, Northern pik
Brook trout.

Thermal pollution literature must be critically su
marized and experimental objectives must
selected before research will advance. The curre
interest in thermal pollution results from publiciz
concern and the easiness of measuring and co
trolling temperatures but disregards problems su
as thermal stratification, nonspontaneity of te
peratures, or climatic effects. Although water sta
dards have been recommended, optimum rath
than maximum zone temperatures should be us
to develop more curves of annual temperatu
regimes. Modification of the winter chill-period
the primary suggestion, and input balance is seen
an outmoded substitute for water treatment. S
objectives for the study reported are: A determin
tion of which species among thirty from the stu
list require a chill-period during the winter mont
to imitate reproduction; studies to determine t
critical periods in the life cycle of the desirable sp
cies and the temperatures required during the
critical periods; a determination of the temper
tures providing optimum growth for individual sp
cies; temperature requirements for food organisn
of the species that are known to be important or e
sential; an evaluation of the rate of temperatu
change that is acceptable for various species; veri
cation of laboratory-derived results in a semi-nat
ral situation where all elements of the ecosyste
must function together to produce a harvestab
fish crop. The final measure of temperature effe
will be the pounds-per-acre of fish produce
(Sherman-Vanderbilt)

THE RESISTANCE AND ACCLIMATIZATIO OF MARINE FISHES TO TEMPERATUR CHANGES. I. EXPERIMENTS WITH GIRELL NIGRICANS (AYRES),
Scripps Institution of Oceanography, La Joll
Calif.
Peter Doudoroff.
Biology Bulletin, Vol 83, No 2, p 219-244, 194
26 p, 5 fig, 4 tab, 29 ref.

Descriptors: *Thermal pollution, *Heat resistanc
*Cold resistance, Acclimatization, Ecolog
Marine fish, Variability, Fluctuation, Biology.
Identifiers: *Girella, Heat-coma, Chill-coma, Su
vival criterion, Time-temperature curve.

The resistance of young Girella nigricans (Ayre
to low and high temperatures and the changes
tolerance produced by acclimatization are e
amined. The fish were killed by moderately lo
temperatures, the lower limits of temperatu
tolerance being no more extreme, in comparis
with normal environmental temperatures, than t
corresponding upper limits. The relationsh
between the duration of exposure to the test te

tures and the upper or lower 'median tolerance
s' is representable by smooth time-tempera-
curves of tolerance. Acclimatization to dif-
nt temperatures has a pronounced influence on
orm of the respective time-temperature curves
olerance. Experiments on the rate of accli-
zation correlate the conclusion, based on earli-
bservations, that heat-resistance in fish is
ed rapidly after a rise of temperature and lost
ly after cooling. Acclimatization to cold is rela-
y slow, and cold-resistance is lost no more
ly than it is acquired. After a given change in
ronmental temperatures, about 50 percent of
otal resulting change in cold-tolerance occurs
wo days, and complete acclimatization is
eved within about twenty days. Injury by
ing is no less important as a possible limiting
or in the distribution of marine fishes than heat
y. Figures and tables show the collection and
elation of tolerance limits and acclimatization
tion data. (Sherman-Vanderbilt)

at resistance, *Acclimatization, Temperature
rol, Respiration, Dehydration, Salinity, Marine

tifiers: *Fundulus, *Atherinops, Heat-coma,
coma, Girella, Duration, Osmoregulative
re.

resistance of the hardy mari ne fish Fundulus
ipinnis and of the delicate Atherinops affinis to
and high temperatures is examined in relation
mperatures of previous acclimatization and to
erature conditions in the natural habitats of
ishes. The relationships between the time (du-
n) of exposure to test temperatures and the
age (median) limits of temperature tolerance
ate the value of prolonged tests in the study of
tance to cold and heat. Marked suscepti bility
arine fishes to chilling (i.e., injury at non-freez-
ow temperatures) and the influence of accli-
zation upon temperature tolerance are con-
ed. The death of Fundulus at slowly lethal low
eratures, but not at rapidly lethal tempera-
, is preceded in the normal medium (sea-
r) by evident dehydration of the tissues and is
ved by dilution of the medium. Osmoregulative
re is indicated as one of the causes of slow
n at low temperatures in seawater, but not of
l death at more extreme low temperatures,
h may be caused partly by respiratory
rbances. (Sherman-Vanderbilt)

riptors: *Rainbow trout, *Thermal pollution,
atic environment, Temperature gradient,
graphy.
ifiers: Preferred temperature, Acclimation
erature.

purpose of this study was to determine the
ted or preferred temperature of the rainbow
, Salmo gairdneri Richardson, at various accli-
n temperatures. The preferred temperature
n generally has been found to be influenced by the temperature at which they are acclimated. The fish were reared at the laboratory from eggs supplied by the Provincial Fish Hatchery at Normandale, Ontario, in May 1955. The modal preferred temperatures of rainbow trout acclimated to 5 deg C, 10 deg C, 15 deg C and 20 deg C were determined photographically to be 16 deg C, 15 deg C, 13 deg C and 11 deg C, respectively. The final preferendum was 13 deg C. The phenomenon of decreasing preferred temperature with increasing acclimation temperature has not been reported for any other species of fish. (Ross-Vanderbilt)

ACCLIMATION TO TEMPERATURE IN THE MARINE COPEPOD, CALANUS FINMARCHICUS (GUNNER.),
Dalhouse Univ., Halifax (Nova Scotia). Inst. of Oceanography.
K. Halcrow.
Limnology and Oceanography, Vol VIII, No 1, p 1-8, Jan 1963. 8 p, 6 fig, 2 tab, 19 ref.

Descriptors: *Acclimatization, *Marine animals, *Copepods.
Identifiers: *Respiratory rate, Oxygen uptake, C. finmarchicus, Oxygen uptake overshoot.

C. finmarchicus has cosmopolitan distribution and is found in waters at -2 deg to 22 deg C. Test organisms were harvested with plankton tows (No. 000 mesh nylon net) from the coastal waters of Nova Scotia. Respiratory rate was determined with a modified oxygen electrode technique. Three acclimation rates were employed, 4 deg, 10 deg and 20 deg C. Copepods collected in March and April showed the highest respiratory rate at 10 deg, while those collected in August had the highest rate at 20 deg. In each case the lowest rate was at 4 deg. Overshoot of oxygen uptake was demonstrated when copepods were exposed to a sudden temperature change, i.e., oxygen consumption increased greatly in the first 2 hr and thereafter fell to a constant level in 4 hr. THE EFFECT OF TEMPERATURE ON THE DEOXYGENATION OF A POLLUTED ESTUARY,
Public Health Service, Philadelphia, Pa. Delaware Estuary Comprehensive Study.
David H. Stoltenberg, and Matthew J. Sobel.
Journal of the Water Pollution Control Federation, Vol 37, No 12, p 1705-1715, Dec 1965. 11 p, 2 fig, 3 tab, 12 ref.

Descriptors: *Thermal pollution, *Water pollution effects, *Dissolved oxygen, *Biochemical oxygen demand, Sanitary engineering, Natural streams, Estuary sampling, Incubation, Organic loading, Bicarbonates, Phosphates, Chlorides.
Identifiers: *Delaware estuary, *Decay coefficient, Analysis of covariance, Temperature coefficient, Van't Hoff-Arrhenius formula, Sodium theosulfate.

A systems analysis technique has been presented for describing the space and time variations of dissolved oxygen (DO) in a body of water. The response of the water body system to the action of a 'forcing function' can be measured in terms of t he specific parameter, DO, which is affected by the biochemical oxygen demand (BOD). Because of a lack of sufficient data for K (deoxygenation constant) for the Delaware Estuary comprehensive study, the following work was done to determine its values in the estuary. The decay coefficient was related empirically to stream temperatures after the effect on the coefficient of organic matter concentration and other factors was tested. There are two sections: (1) a study of the effects of collection temperature, sampling location, tidal stage, and organic loading on K for various samples incubated at the same temperature; and (2) determinations of K as a function of incubation temperature. (Sherman-Vanderbilt)

SOME EXPERIMENTS UPON TEMPERATURE ACCLIMATIZATION AND RESPIRATORY METABOLISM IN FISHES,
Scripps Institution of Oceanography, La Jolla, Calif.
F. B. Sumner, and P. Doudoroff.
The Biological Bulletin, Vol 74, No 3, p 403-429, June 1968. 27 p, 7 fig, 9 tab, 19 ref.

Descriptors: *Respiration, *Metabolism, *Thermal pollution, *Aquatic environment, Potassium cyanide.
Identifiers: *Temperature acclimatization, *Gillichthys mirabilis, Cyanide, Boiled seawater, Lethal heat, Lethal cold, Urethane, Respiratory movements, Fish metabolism, Fundulus parvipinnis.

Fishes (Gillichthys mirabilis) having different temperature histories were subjected to KCN, to boiled seawater, and to temperatures high or low enough to be lethal. Urethane, an anesthetic, was used in a limited number of experiments. The time of death (or of anesthetization) was recorded for each of the fishes (nearly 3,000). Counts of respiration were made in numerous cases. Death in both KCN and i n boiled water was speedy in proportion to the temperature, the reciprocals of the times of death forming an approximate logarithmic series when plotted against temperature. The temperatures used were 10 deg, 15 deg, 20 deg, 25 deg, and 30 deg C. In the case of KCN, a low correlation was found to exist between the duration of previous acclimatization to high or low temperatures and the degree of resistance to KCN at those temperatures. When fishes which had been acclimatized to high (30 deg) and low (10 deg) temperatures were tested in KCN, boiled water or urethane at 20 deg, there was a consistent reversal in the resistance of the respective lots. Death in de-oxygenated seawater was more than 60 percent slower, at the same temperatures, than in KCN solution. Even though the size of the fish appeared to have little or no influence upon its resistance to lethal heat or to cyanide poisoning, it was found that smaller fishes had a more rapid respiratory rhythm, and succumbed more rapidly in boiled water than larger ones. (Ross-Vanderbilt)

BIOCHEMICAL EFFECTS OF COOLING-WATER DISCHARGE INTO PUBLIC WATERS (DUTCH),
Instituut voor Gezondheidstechniek TNO, The Hague (Netherlands).
J. K. Baars.
De Ingenieur, Gezondheids techniek, p G85-G88, Dec 20, 1968. 4 p, 3 fig, 4 tab, 1 ref.

Descriptors: *Thermal pollution, *Waste-water treatment, *Water pollution effects, Biochemical oxygen demand, Chemical properties, Cooling water, Reaeration.

'Thermal pollution' of a body of water, as being caused by the disposal of cooling water of higher temperature, has various aspects which - under certain conditions - can be detrimental to aquatic life as such. The form of the resulting oxygen sag curve is reviewed, with data from several sources shown. From the biochemical point of view the paper gives a condensed survey of the different factors active in this respect, and the eventual precautionary or remedial measures to be envisaged. THE EFFECTS OF HIGH TEMPERATURES ON ROACH (RUTILUS RUTILUS) I. THE EFFECTS OF CONSTANT HIGH TEMPERATURES,
King's Coll., London (England). Dept. of Zoology.

Anthony W. Cocking.
The Journal of Experimental Biology, Vol 36, No 1, p 203-216, Mar 1959. 14 p, 4 tab, 4 fig, 36 ref.

Descriptors: *Thermal pollution, *Heat resistance, *Acclimatization, Temperature control, Fish physiology, Heated water.
Identifiers: *Rutilus rutilus, *Thermal relations, Fry, Median temperature tolerance, High lethal limit, Asphyxial concentration.

In a laboratory investigation a fairly hardy fish, Rutilus Rutilus (Roach), was tested for high lethal temperature limits and median thermal tolerance levels. These results and observations of behavior patterns were then compared to those of a fish with different eurythermal and stenothermal habits. The stages and symptoms of the fish after transferral to a constant higher temperature are described. The five stages with some variations are: period of no response, initial distress, recovery, final distress, loss of control, death or complete recovery. Data results included the following: (1) The temperature at which 50% of a sample of roach (Rutilus rutilus) die within a week cannot be raised above 33.5 deg C by raising the acclimatization temperature. (2) The mean asphyxial concentration of oxygen at 30 and 32 deg C is approximately 0.8 mg./1. (3) Median survival time at any lethal temperature increases with increase in acclimatization temperature; survival time for any acclimatization temperature decreases as test temperatures increase. (4) The behavior, on transfer to higher temperatures, depends on the acclimatization temperature and the size of the jump in temperature and can be divided into five characteristic stages. (Sherman-Vanderbilt)

THE EFFECTS OF HIGH TEMPERATURES ON ROACH (RUTILUS RUTILUS); II. THE EFFECTS OF TEMPERATURE INCREASING AT A KNOWN CONSTANT RATE,
King's Coll., London (England). Dept. of Zoology.
Anthony W. Cocking.
Journal of Experimental Biology, Vol 36, No 1, p 217-226, Mar 1959. 10 p, 5 fig, 1 tab, 12 ref.

Descriptors: *Aquatic environment, *Thermal pollution, *Fish behavior, Temperature, Acclimatization.
Identifiers: *Lethal temperatures, Roach (Rutilus Rutilus), Oxygen concentration effects, Ammonia effects, High temperature effects, Carbon dioxide effects.

Temperature effects on aquatic life are investigated in an environment where the temperature is rising at a constant rate. The following results were obtained: (1) When roach were acclimatized to 20 deg C and then subjected to five constant rates of temperature rise, the range of death temperatures depended on the interaction between the opportunity for acclimatization and the exposure to lethal temperatures. (2) At 1/20 deg C an hour rise in temperature, roach acclimatized fully, died over the longest temperature range (30.3-35/8 deg C) had the highest mean death temperature (32. deg C) and died over a disproportionate length of time (up to 88 hr.) when compared with other rates. The death temperature range at 1/10 deg C an hour was 30.8-32.0 deg C (mean 31.4 deg C) and at 8/10 deg C an hour was 31.5 to 32.9 deg C (mean 32.9 deg C). (3) Roach cannot acclimatize fully at rates faster than 1/20 deg C an hour though some acclimatization takes place at a rate of 8/10 deg C an hour. (4) Roach excrete more ammonia as the temperature rises but the increase depends on the rate of temperature rise and is delayed for up to 240 hr. at 1/20 deg C an hour. (5) The behavior showed characteristic changes. (6) Roach died from the posterior end forwards; the heart was beating and the gall bladder abnormal when the body was opened. (Ross-Vanderbilt)

FUTURE ASPECTS OF COOLING-WATER DISCHARGE BY ELECTRICAL POWER PLANTS (DUTCH),
Directie Waterhuishouding en Waterbeweging van de Rijkswaterstaat, Delft (Netherlands).
P. J. Wemelsfelder.
De Ingeni eur, Bouw-en Waterbouwkunde 15, p B179-B198, Dec 20, 1968. 10 p, 17 fig, 7 tab.

Descriptors: *Thermal pollution, *Water utilization, *Water resources development, *Cooling-water, *Electric power plants, Waste-water disposal, Water supply, Thermal properties.
Identifiers: *Netherlands, Cooling-water discharge, Natural water resources.

For the first electrical power plants in the Netherlands the availability of water for their cooling purposes did not give rise to any problem. The continuous increase of such plants, in numbers and capacities has introduced, however, the necessity of situating those new and bi gger plants in the vicinity of major bodies of water, in order to safeguard the cooling-water requirements and at the same time to keep the effects of discharge within acceptable limits. The still growing demand for electrical energy makes it inevitable to investigate the entire matter more profoundly. In the present paper a quantitative analytical treatment is given of the practical use of available natural water-bodies in the Netherlands in view of the future needs as to cooling purposes. THERMAL ACCLIMATION AND TEMPERATURE SELECTION IN ATLANTIC SALMON, SALMO SALAR, AND RAINBOW TROUT, S. GAIRDNERI,
Carleton Univ., Ottawa (Ontario). Dept. of Biology.
M. Yaqub Javaid, and John M. Anderson.
Journal of Fisheries Research Board of Canada, Vol 24, No 7, p 1507-1513, July 1967. 7 p, 2 fig, 1 tab, 10 ref.

Descriptors: *Thermal pollution, *Aquatic environment, *Temperature gradient, Atlantic salmon, Rainbow trout.
Identifiers: *Thermal acclimation, Temperature selection.

The selected temperature for Atlantic salmon and rainbow trout, as determined in a horizontal gradient, increases with acclimation temperature over the acclimation range 5 to 20 deg C for salmon and 10 to 20 deg C for trout. The final preferendum for salmon is about 17 deg C. The results for rainbow trout suggest that the type of gradient used, i.e., vertical or horizontal, has a marked influence on the experimentally determined relation between acclimation temperature and selected temperature. The final preferendum for rainbow trout was not reached, evidently it is higher than 20 deg C. Five different groups of fish were tested for each species at each acclimation temperature. (Ross-Vanderbilt)

RELATIONSHIP OF TEMPERATURE TO TOTAL ANNUAL GROWTH IN ADULT SMALLMOUTH BASS,
Department of Lands and Forests, Picton (Ontario). Glenora Fisheries Station.
Daniel W. Coble.
Journal of Fisheries Research Board of Canada, Vol 24, No 1, p 87-99, Jan 1967. 13 p, 1 fig, 4 tab, 23 ref.

Descriptors: *Water temperature, *Growth rates, *Smallmouth bass, *Fish physiology, Thermal pollution, Aquatic environment.
Identifiers: South Bay, Lake Huron.

The purpose of this study was to find out if total annual growth of smallmouth bass, Micropterus dolomieui Lacepede, is related to temperature and, if so, what variation around the relationship e Two sets of information were used: original da two populations of smallmouth bass in Ontar which rather detailed information on growt temperature were obtained, and published da growth of smallmouth bass in various w throughout the North American range. Total y growth of smallmouth bass of ages 3-5 in S Bay, Lake Huron, and in several other widely tered populations was related to mean su water temperature for the period July through tember, more growth being associated with wa waters. The difference in the manifestation growth-temperature relationship appears t real, rather than a result of differences in da treatments of them, and indicates, therefore other factors may influence total annual grow much as, or more than, temperature. (Ross derbilt)

RELATION OF PHOSPHATES TO EUTRO CATION,
North Carolina Univ., Chapel Hill. Dept. o vironmental Sciences and Engineering.
Charles M. Weiss.
J Amer Water Works Ass, Vol 61, No 8, p 387 Aug 1969. 5 p, 2 fig, 4 tab, 22 ref.

Descriptors: *Eutrophication, *L *Phosphates, Nutrients, Algae, Water pollutio fects, Water pollution sources, Aquatic produ ty, Limnology, Plankton, Primary product Trophic level.
Identifiers: Lake Tahoe.

The relationship of phosphates in water to pri production is examined, and the phosphorus in natural lake biological systems is outl Although higher than normal macronutrient l will generally produce an increase in leve productivity or shift of trophic status, the sp interrelationships of each nutrient factor an ceedingly complex and remain unclear. The bi ical storage of phosphorus by algae in excess o mediate growth requirement, its secretion as ble organic phosphorus, and its reuse would ap to be a significant factor in satisfying nut levels, particularly for those species with phosphorus requirements. Increases in tro status are generally associated with invasio blue-green algae, which have capability nitrogen fixation with resulting enhancemen nitrogen levels and acceleration of the ra eutrophication. The rate of trophic respons each lake or reservoir to changes in macronut levels involves not only nutrient change, but the total chemical and physical characteristi the particular basin. The chemical nature o

ular phosphorus species, its association with dal or particulate materials and the specific iated phytoplankton all contribute to the rate ilization of the phosphate pool and thus the f eutrophication. (Knapp-USGS)

RADATION OF GAMMA - BHC IN SIMU-ED LAKE IMPOUNDMENTS AS AF-TED BY AERATION,
onsin Univ., Madison. Dept. of Soils.
Newland, G. Chesters, and G. B. Lee.
Water Poll Control Fed, Vol 41, part 2, p 174-May 1969. 25 p, 1 tab, 7 fig, 28 ref. OWRR 3-016-WIS.

riptors: *Biodegradation, *Insecticides.
ifiers: GAMMA-BHC, Isomerization, *Aera-ffects, *Simulated lake impoundment.

egradation of gamma-BHC in simulated aero-nd anaerobic lake impoundments was deter-l and anaerobic degradation was much more than aerobic degradation. In the aerobic ated lake impoundment, degradation of 15 nt of the added gamma-BHC occurred in hr and the isomer alpha-BHC was formed as egradation product. In the anaerobic im-lment some 90 percent of the added gamma-was degraded in the 2,100-hr incubation to the isomers alpha- and delta-BHC. se of the profound effect of oxygen on dation rates and the apparent 'lag phase' of action, it is concluded that the isomerization nma-BHC occurs by a biological mechanism. thermodynamic stability of benzene hex-ide isomers is in the order gamma-BHC< BHC< delta-BHC< beta-BHC. However, lization of gamma-BHC and alpha-BHC from poundments prevented the formation of the stable isomers, namely, delta- and beta-BHC gh in the later stages of degradation in the bic impoundment some delta-BHC was d. The isomerization leads to detoxification insecticide, e.g., the acute oral lethal dosage) for rats is 125 mg/kg body weight for a-BHC, 500 mg/kg for alpha-BHC and 6,000 for delta-BHC.

STEAM-ELECTRIC POWER AND THERMAL POLLUTION,
Sports Fishing Inst.
R. H. Stroud.
SFI Bulletin, No 201, p 1-3, Jan-Feb, 1969. 3 fig.

Descriptors: *Thermal pollution, *Electric power plants, *Cooling towers, *Cooling ponds, *Wastewater treatment, Administration, Public utilities, Freshwater runoff.
Identifiers: *Closed circuit cooling.

Predicted and actual data displaying the danger to overheated streams of increasing steam electric station industries by heat discharge is reported as well as the available cooling facilities and a generalized cost for the process (estimate 3% of production cost). These systems are rated from least to most effective by the author as: once-through cooling (negligible effect), evaporative cooling towers (reduction of differential between heated discharge and intake temperatures to 1/2), cooling pond, closed circuit cooling, combinations. Thermal pollution is seen as within means of control with technology and administrative policy to be utilized when there is a public demand. Recent power company projects are described and those plants with immediate need for controlling measures are named. It is noted that a recent listing of conventional steam plants (of 500 mw or larger) 7 used cooling towers, 5 cooling ponds, 21 once-through cooling, and 14 did not report. Of 32 completed or planned nuclear facilities, 7 use cooling towers and the rest once-through cooling. Some details are presented for a few plants deemed adequate. (Sherman-Vanderbilt)

Identifiers: *National Power Survey, Nuclear breeder reactors.

Thermal pollution sources, effects, control and standards enforcements are discussed. Although thermal change is viewed as natural, the heat capacity of aquatic environments in the United States is often exceeded, and the increasing power production is an index of increasing thermal pollution. With higher water temperatures, toxic effects are greater, the water is less capable of assimilating other wastes, and the dissolved oxygen supply is less. One of the criteria of the Water Quality Act is water temperature, while recognizing natural climatic changes. In the state regulations, the varied social water interests are considered. Technological solutions to waste heat disposal are listed as follows: (1) methods to minimize the effect of the waste heat on the aquatic environment; (2) means to reduce waste heat produced in thermal generation plants; (3) uses for waste heat; (4) methods to cool the present amount of waste heat; (5) new non-polluting methods of power generation. EUTROPHICATION OF THE ST. LAWRENCE GREAT LAKES,
Bureau of Commercial Fisheries, Ann Arbor, Mich.
Alfred M. Beeton.
Limnology and Oceanography, Vol 10, No 2, p 240-254, 1965. 4 fig, 3 tab, 52 ref.

Descriptors: *Great Lakes, *Eutrophication, *Hypolimnion, *Lake morphometry, *Lake morphology, *Dissolved oxygen, *Dissolved solids, *Nutrients, Oligotrophy, Phosphorus, Nitrogen, Biota, Sewage disposal, Domestic wastes.
Identifiers: *Mesotrophy, Transparency, Specific conduction.

Lakes Huron, Michigan, and Superior are classified as oligotrophic lakes on the basis of their biological, chemical, and physical characteristics. Lake Ontario, although rich in nutrients, is morphometrically oligotrophic or mesotrophic because of its large area of deep water. Lake Erie, the most productive of the lakes and the shallowest, is eutrophic. Several changes commonly associated with eutrophication in small lakes have been observed in the Great Lakes. These changes apparently reflect accelerated eutrophication in the Great Lakes due to man's activity. Chemical data compiled from a number of sources, dating as early as 1854, indicate a progressive increase in the concentrations of various major ions and total dissolved solids in all of the lakes except Lake Superior. The plankton has changed somewhat in Lake Michigan and the plankton, benthos, and fish populations of Lake Erie are greatly different today from those of the past. An extensive area of hypolimnetic water of Lake Erie has developed low dissolved oxygen concentrations in late summer within recent years. The information is detailed in tables and graphs. THERMAL POLLUTION OF WATER COURSES,
Potomac Electric Power Co., Washington, D.C.
L. W. Cadwallader.
Proceedings of the Nineteenth Industrial Waste Conference, Purdue Univ, Lafayette, Indiana, p 9-11, May 5-7, 1964.

Descriptors: *Thermal pollution, *Environmental effects, *Water pollution effects, *Industrial wastes, *Water quality control, Freshwater, Nonconsumptive water use, Model studies, Biology.
Identifiers: *Biodynamic cycle.

A general account is given of the thermal pollution problem and research needs. Most highly recommended are field studies, viewing thermal pollution in the context of natural variations in temperatures. Laboratory information about temperature effects has been generalized but without substantiating data about natural conditions. There is little knowledge of the effects of heated discharges on the receiving water, especially on the competitive biodynamic cycle. World War II is seen as the beginning of concern about water resources (freshwater) because of new industrial expansion. The establishment of water standards is challenging because unqualified restriction of thermal discharges would severely limit the nation's electricity generating capacity. A hydraulic model study has been made to determine the intake-discharge arrangement for the best overall effect for Chalk Point on the Patuxent River. Final design details were based on temperature elevation in the river as predicted by the model. The Potomac Electric Power Company intends to monitor the site after operation begins, thus providing valuable field information. (Sherman-Vanderbilt)

THE EFFECT OF THE ADDITION OF HEAT FROM A POWERPLANT ON THE THERMAL STRUCTURE AND EVAPORATION OF LAKE COLORADO CITY, TEXAS, (STUDIES OF EVAPORATION),
Geological Survey, Washington, D.C.
Earl G. Harbeck, Jr., G. E. Koberg, and G. H. Hughes.
Geological Survey Professional Paper 272-B, U.S. Government Printing Office, Washington, 1959.

Descriptors: *Evaporation, *Thermal pollution, *Energy budget, Heat, Reservoir evaporation, Cooling water, Powerplants.
Identifiers: Powerplant, Thermal structure.

Lake Colorado City, a reservoir in north-central Texas, is used as a source of cooling water for a thermal-electric powerplant. Evaporation from the lake was determined by the energy-budget method for the period July, 1954 to October, 1955. Analyses indicated that if no heat had been added by the powerplant, the water-surface temperature would have been only 0.8 deg C lower than that observed. The temperature rise was almost directly proportional to the heat input. The increase in evaporation from Lake Colorado City, when expressed as a volume, was directly proportional to the amount of heat added and was practically independent of reservoir contents. The entire lake is being effectively utilized in disposing of heat. A comparison between average lake temperatures and plant intake water temperatures indicated that water was withdrawn from all levels of the lake above the pump intakes. (Ross-Vanderbilt)

OBSERVATIONS ON THE INFLUENCE OF THE NEW JOHNSONVILLE STEAM PLANT ON FISH AND PLANKTON POPULATIONS,
Tennessee Game and Fish Commission.
William Dryer, and Norman G. Benson.
Tenth Annual Conference Southeastern Association of Game and Fish Commissioners, Biological Abstract, Vol 10, p 85-91, 1957. 7 p, 3 tab, 1 fig, 1 ref.

Descriptors: *Thermal pollution, *Fish migration, *Fish food organisms, *Freshwater lake, Sport fish.
Identifiers: *Power plant effluent.

This study covered the period October 1955 to August 1956. Water for condenser cooling is drawn from Kentucky Lake at 633,000 gal/min. Spent water, raised in temperature ca. 10 deg F is released into a rectangular discharge harbor of 82 acres from which it is discharged into the main lake. Plankton collection in the harbor and main lake showed no significant increase in productivity associated with steam plant discharge. Tremendous numbers of shad were observed in the discharge harbor during winter months, probably attracted by warm water rather than plankton. The abundance of sauger and skipjack was related to the numbers of threadfin shad. All were rare in the harbor after March 15 when the temperature approached 60 deg. At that time, blue catfish, channel catfish and bluegill began to concentrate in the harbor. The catfish left the harbor in July when the temperature exceeded 80 deg. Fish population in the harbor differed greatly from the main lake where white bass, white crappie and large mouth bass predominate. Temp. of harbor - 51 to 55 deg, Lake - 41 to 45 deg. (Malaney-Vanderbilt)

TRANSLOCATION OF PHOSPHORUS IN A TROUT STREAM ECOSYSTEM,
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife; and Institute for Fisheries Research, Ann Arbor, Mich.
Robert C. Ball, and Frank F. Hooper.
Proc 1st Nat Symp on Radioecology, Colorado State Univ, Fort Collins, Sept 10-15, 1961. Radioecology, 1963, Reinhold Pub Corp, NY and Amer Inst of Biological Sciences, Wash, DC, Schultz, Vincent and Klement Jr, Alfred W (Eds), p 217-228. 4 fig, 7 tab, 16 ref.

Descriptors: *Translocation, *Phosphorus radioisotopes, *Trout, *Streams, *Ecosystems, Radioactivity, Biota, Cycles, Michigan, Invertebrates, Fish, Temperature, Tracers, Sampling, Periphyton, Aquatic plants, Background radiation, Geochemistry, Spring waters, Phosphorus, Organophosphorus compounds, Bacteria, Diatoms, Detritus, Cycling nutrients, Light intensity, Fertilization, Growth rates, Equilibrium, Chara, Algae, Ammocetes, Lampreys, Omnivores.
Identifiers: Michigan, Cheboygan County, Sturgeon River, Fluorescein, Macrophytes, Ground solids, Uptake, Consumer organisms, Simulium, Physa, Salmo trutta, Entosphenus lamottenii, Gammarus, Cordulegaster.

To explore movement of phosphorus in a cold-water stream and relationships between phosphorus and stream productivity, spikes of approximately 23 millicuries of phosphorus-32 (P-32) were added to the water during three summers. The loss pattern varied from year to year, with much uptake apparently attributed to periphyton and three aquatic macrophytes. P-32 rate of loss from plants to water decreased with time and concentration approached equilibrium level in 15 to 20 days after spike was released. Decrease change rates suggested that plants were removing re-cycled phosphorus from the stream water. Highest uptake by periphyton occurred in 1958 and 1960; lowest in 1959. This pattern was reversed by aquatic macrophytes. Concentration curves for consumer organisms reflected differences in metabolic turnover rates and food relationships. In Simulium, concentrations quickly rose to a high level, seemingly during passage of the spike. Other small filter feeders and periphyton scrapers also accumulated P-32 rapidly, then lost it quickly. Accumulating P-32 was slower for large omnivorous stream insects and smaller predacious forms. Differences in circulation through the ecosystem, as noted during the 3-year test period, may be due to distribution of P-32 between soluble and particulate phases. Identifiers: *Waste water (Municipal and industrial), *Phosphorus sources, *Nuisance plant growths, *Nutrient control, *Phosphorus concentrations, Micronutrients, Aquatic ecosystem, Midge larvae, Lake stratification, Surface area (Lakes), Phaedactylum, Waste water diversion, In-stream treatment, Bottom sealing, Lake dilution.

Reduction of wastewater phosphorus inflows to receiving waters is necessary to check accelerating cultural eutrophication. Minimizing phosphorus inflows to surface waters is recommended because it is the most easily reduced of all constituents in waste waters essential to aquatic plant growth. The author suggests that prevention of biological nuisances requires total phosphorus concentrations not exceeding 100 micrograms/liter at any point in flowing water; and 50 micrograms/liter where water enters a standing body (lake or reservoir). The most effective means of controlling phosphorus levels in lakes now are treatment of nutrient point sources, waste water diversions around lakes, and dilution within lakes where feasible. Once nutrients are combined within the ecosystem of the receiving water, their removal is tedious and expensive. Results of harvesting of aquatic crops, dredging, and other means to remove nutrients after they have reached receiving waters should be compared with inflowing nutrient quantities to evaluate effectiveness. The preservation of surface waters in a usable state will depend in the long run on maximum nutrient removal at the waste sources. (Ketelle-Wis)

A WATER-QUALITY HIERARCHY FOR ARID LANDS,
North Carolina Univ., Chapel Hill. School Public Health.
Daniel A. Okun.
IN W.G. McGinnies and B.J. Goldman, Eds., Arid Lands in Perspective, p 289-296, University of Arizona Press, Tucson, 1969. 8 p, 19 ref.

Descriptors: *Water reuse, *Potable water, Public utilities, Arid lands, Arizona, Water conservation, Taste, Reclamation (Waste water), Water utilization, Competing uses, Water supply, Water shortage, Public utilities, Water distribution (Applied), Water pollution, Viruses, Chemical wastes, Planning.
Identifiers: *Water-quality hierarchy.

As population increases and additional waters become polluted, direct reclamation and reuse of waste waters is rapidly becoming a necessity, especially in arid regions. Public acceptance of this varies in relation to experiences and attitudes. Treatment plants have been shown to be ineffective in elimination of many viruses that are present in wastewater. Also many chemical wastes of low concentration can be deliterious to health with long term use. It is proposed that municipalities in watershort areas, where less than 10 per cent of the water used is required to be of drinking-water quality, have a dual system. One system could consist of a high-quality potable supply for drinking and culinary purposes and the second system, with a lesser-quality supply, would serve for flushing, washing, lawn irrigation, and other nonpotable uses. Cost of dual supplies are discussed and it is concluded that they would be significantly reduced if the two systems were planned and installed simultaneously. This would be facilitated in new cities. The development of a hierarchy of water supplies based on water quality offers a reasonable approach to conserving this resource. (See W69-09210). (Sherbrooke-Ariz)

COOLING TOWERS: PROBLEMS....AND SOME TREATMENT PRACTICES,
Magnus Chemical Co, Inc.
Thomas F. Dalton.
Water Works and Wastes Engineering, Vol 2, p 53-56, Dec 1965. 1 tab, 13 ref.

Descriptors: *Cooling towers, *Cooling water, *Maintenance, *Algicides, *Corrosion control, *Dispersion, Recirculated water, Oxygenation.
Identifiers: *Alkaline cleaning, *Acidic cleaning, Scale preventors, pH adjustment, Bleed-off.

Because cooling towers are in continual use, they must be diligently maintained. Problems in the cooling system and chemical treatment selection factors according to water pollution control ratings are discussed. The following suggestions consider both overall effectiveness and cost of the chemical: Sodium chromate or sodium nitrate as corrosion inhabitors; chlorine as an algicide, polyphosphates or EDTA as scale preventors; sulfuric acid for pH adjustment; a precalibrated conductivity meter connected to a blowdown valve for bleed-off; sodium lignosulfonate as a dispersing agent. Both alkaline and acidic cleaning are recommended. Other uses for cooling water or cooling towers mentioned, are as a hot water recirculating system or as part of a modified activated sludge process. (Sherman-Vanderbilt)

HYPERBOLIC COOLING TOWERS WITH RESERVOIR STORAGE OF MAKEUP TO SERVE THE PROPOSED KEYSTONE GENERATING STATION,
Gilbert Associates, Inc., Reading, Pa., and Pennsylvania Electric Co., Johnstown.
Alexander F. Smith, III and Ralph E. Bovier.
Proceedings of the American Power Conference, Vol 25, p 406-415, 1963. 5 fig, 1 tab, 3 ref.

Descriptors: *Power plants, *Reservoir storage, *Cooling towers, *Waste-water treatment, *Thermal pollution, *Design criteria, Stream flow, Fuels, Transmission lines, Cost comparisons, Sites, Condensers.
Identifiers: *Pennsylvania, *Mine-mouth stations, *Keystone plant, Hyperbolic cooling towers.

This article describes the studies which led to the site selection of Keystone generating stations, indicating that large plants can be located on small streams, and proposes cooling arrangements which overcome specific difficulties at a location. The effect of discharges on stream flows during normal and critical years is shown. Coal resources and cost studies and a plant site survey were conducted. Hyperbolic cooling towers were chosen because they were economical for large unit installations with high load factors, they required less space than other units, and their stack heights (approximately 300 ft) minimized fog and air pollution problems. The tower's heat load can be increased by increasing either the water flow or the cooling range. The optimum cooling range was evaluated at 23 deg to 30 deg F. A makeup reservoir is most advantageous because of its mobility. A cost comparison with another river site concluded that the normal economic penalties of a cooling tower plant were not serious if the advantages of a closed-loop cooling tower arrangement were recognized. MUSKEGON COUNTY PLAN FOR MANAGING WASTE WATER.
Muskegon County Board of Supervisors; and Bauer Engineering, Inc., Chicago, Ill.

Muskegon County Metropolitan Planning Commission, Mich, 1969. 130 p, 20 tab, 16 fig, 2 append.

Descriptors: *Land reclamation, *Water management, *Irrigation systems, *Nutrients, *Water quality, Water resources, Land development, Land management, Water quality control, Phosphates, Nitrates, Irrigation.
Identifiers: Muskegon County (Mich).

This report presents a metropolitan plan for enhancement which recognizes waste water as a resource out of place in the environment and seeks to utilize it productively in a program of comprehensive treatment including irrigation of agricultural and forest lands. This plan attempts to coordinate goals, problems, and opportunities of the metropolitan region with physical and engineering factors of water resource and waste management. Two basic precepts in the formulation of this plan are the concept of wastes as resources out of place and the conversion of open-ended management systems to closed systems. The first precept simply means that waste products or pollutants in one part of the water system might be resources in another place. The open system is typical of existing waste water systems where the wastes are ultimately discharged from the system. A closed system, however, retains the wastes by re-utilization. These precepts have been applied in the development of a waste water management system based on the utilization of treated waste water for irrigation. Muskegon County presently has large tracts of land unsuitable for agriculture due to lack of water and soil nutrients. The use of waste water would make this land productive through the addition of water and soil nutrients, especially nitrates and phosphates. In this particular case this technique served as potential aids in the solution of two basic problems of the area. First, the degraded water quality of water bodies in Muskegon County would be improved by the elimination of the discharge of waste water into the water bodies. Second, the scheme proposed would help to ameliorate a depressed economy in the area. The improvement in water quality would provide opportunities for a recreation industry which is presently minimal. The use of waste water nutrients for irrigation purposes would expand the agricultural sector which is presently underdeveloped. (Davis-Chicago)

DESIGN OF SANITARY SEWAGE COLLECTION SYSTEM BY ELECTRONIC COMPUTER,
Polytechnic Inst. of Brooklyn, N.Y. Dept. of Civil Engineering.
H. F. Soehngen, and P. R. DeCicco.
Soc Econ Planning Sci, Vol 1, No 3, 391-402, July 1968. 12 p, 11 fig.

Descriptors: *Design, *Sanitary engineering, *Sewage treatment, *Optimization, *Flow measurement, Mathematical models, Systems analysis, Sewers, Monitoring, Harbor.

The development of a systems approach to sanitary sewers design was discussed and a mathematical flow model developed. The project had two primary objectives, (a) to produce a computer oriented design which would produce results in less time with less cost and with a higher level of precision and (b) to utilize the memory and speed capability of the computer for optimal sewer design by using iterative techniques which allowed opportunity for redesign with continuous monitoring of cost implications. The integrated computer systems developed were applied to the Merrick Harbor Collection District in Nassau County. Definite economic advantages were observed. Total construction costs were minimized and engineering design costs were substantially reduced. (Thiuri-Cornell)

COMPUTER CONTROL ASPECTS OF AN ACTIVATED SLUDGE TREATMENT PLANT,
Goodyear Tire and Rubber Co., Akron, Ohio.
Ernest J. Neugroschl.
IFAC, Haifa Symp, Comput Contr Nat Resources, Public Util, Sept 1967. 36 p, 12 fig, 11 ref.

Descriptors: *Activated sludge, *Optimization, *Mathematical models, *Automatic control, *Water pollution control, Waste water treatment, Monitoring, Computers, Simulation, Biochemical oxygen demand.
Identifiers: Indianapolis Treatment Plant.

A mathematical steady state model was developed and the services of a computer employed for optimizing the process of pollution control by an automated activated sludge treatment plant. The goal of the study was to devise a plan for automatic control of the treatment plant by creating and maintaining optimum process conditions despite variations in influent flow and concentration; by (1) achieving optimal coordination of variables so as to remove the desired amount of waste, (2) reducing plant operating cost and (3) increasing protection against process failure through continued surveillance and monitoring. Average daily influent flow rates and biochemical concentrations (BOD) obtained from the Indianapolis Treatment Plant were used for a simulation of the control scheme. (Thiuri-Cornell)

No sewage shall be discharged into waters or on land in a manner adversely affecting public water supplies or causing a nuisance. No person or other entity shall construct or alter any sewage facility until complete plans have been approved by the State Board of Health. All plans submitted must contain specifications and an engineer's report. The engineer's report shall include: present and projected sewage flow needs based on population; character of industrial wastes; type of purification method proposed; character of soil through which sewers will be laid and portion which will be below ground water level sewage system components; and complete information on the body of water into which the final effluent is to be discharged. Statutory specifications for settling chambers, sludge digestion chambers, contact beds, trickling filters, and filter sand must be met. The discharge of sludge or screening into watercourses is prohibited. Sewage stabilization pond design, and construction must conform to statutory requirements concerning loading, shape, depth, inlets, outlets, dikes, pond bottoms, fencing, buffer zones and operation. Special dispensation may be given for temporary systems. (Harris-Fla)

Rules for the dependable construction, installa
and operation of waste injection wells are outli
One of the most important and least unders
considerations is the history and effect of the li
waste after it is injected into its receiving fo
tion. Ideally, the sedimentary formation shoul
uniform sandstone, limestone, dolomite, or f
tured shale of large areal extent with suffic
thickness, porosity, and permeability. Injec
horizons should have adequate overlying and
derlying aquicludes, low pressure, and be separ
from freshwater horizons. Formation fluids sh
be compatible with injected fluids and no
plugged wells should penetrate the injection fo
tion near the disposal well. The size and weig
the casing is important depending on the press
and depths encountered and the volume of flui
be injected. Larger injection strings reduce
head injection pressures, but oversize holes
more costly to drill. Injection rates can be
creased via chemical or mechanical stimula
Such methods not only effectively increase
porosity of the critical region of the well bore
also reduce the chance of plugging. To accura
evaluate the hydrologic properties of the disp
formation, injectivity tests should be made
disposal operation must include a prop
designed monitor program to detect failure of
ous components. (Knapp-USGS)

ureau of Reclamation has been authorized by
Fc. of Saline Water to conduct an 8-part pro-
on surface facilities for disposal of desalting
effluents. The program consists of: (1)
ring a state-of-the-art bibliography and a
, (2) test soil samples from a proposed brine
ration pond site, (3) laboratory tests on pond
materials and soil sealants, (4) develop a
oring system for seepage loss measurement,
velop techniques for increasing evaporation
(6) conduct field tests of pond linings and
p optimum application methods, (7) prepare
ual on surface facilities for disposal of desalt-
ant effluents, and (8) conduct an economic
of salt disposal. This review and bibliography
repared as Part I of the Bureau's program.
echnical literature was reviewed for informa-
n all parts of the Bureau's program. A survey
states and the Federal Water Pollution Con-
dministration on water pollution regulations
ning to surface facilities for disposal of desalt-
ant effluents is appended to the review. The
graphy contains 870 references. References
dexed and cross referenced according to 18

Vohlford, California),**
ical Survey, Washington, D.C.; and Escon-
utual Water Co., Calif.
n E. Koberg, and Maurice E. Ford, Jr.
Geological Survey Water-Supply Paper 1809-M, 1965. 28 p, 14 fig, 1 tab, 13 ref.

Descriptors: *Thermal stratification, *Reservoirs, *Thermal pollution, Solar radiation, Wind, Mixing, Evaporation, Water quality.
Identifiers: Lake Wohlford (Calif.), Surface heating, Surface cooling, Floating aerator, Air-bubbling system, Plastic hose air-distribution system, Temperature prediction.

Thermal stratification in lakes and reservoirs increases the concentration of certain undesirable substances in the hypolimnion with an accompanying decrease in the dissolved-oxygen concentration. The temperature distribution within a lake is a function of diffusion and conduction, and such external agencies as solar radiation, wind, inflow, and outflow. The use of air bubbling to artificially induce mixing, successful in several investigations reported in the literature, is studied in detail in Lake Wohlford in collaboration with the Escondido Mutual Water Co. of Escondido, California. The results of the Lake Wohlford study indicate that the air-bubbling system is economically feasible to remove undesirable taste and odors from the water used for domestic purposes and to increase the dissolved-oxygen concentration in the hypolimnion of the lake. The results also indicate that the elimination of thermal stratification can reduce evaporation. The Lake Wohlford study and other tests cited have not presented enough data to define criteria for design of an air-bubbling system for a thermally stratified reservoir of a given capacity. Further studies are needed so criteria can be established. (Ross-Vanderbilt)

PRACTICAL CONTRIBUTIONS TO ASSURE NORMAL BIOLOGICAL CHARACTERISTICS OF DRINKING WATER (ROMANIAN),
Servan Constantinescu, and Ana Ionescu.
Hidrotehnica, Gosp Apelor, Meteorol, Vol 13, No 3, p 142-146, Mar 1968. 5 p, 7 fig, 1 tab, 6 ref.

Descriptors: *Water treatment, *Oligochoctes, *Iron bacteria, *Water supply, Sources, Biological properties, Water properties, Chlorine, Chlorination, Potable water.
Identifiers: *Romania, Bucharest water supply, Water chlorination.

The problem of eliminating animal and vegetal organisms from drinking water was mostly restricted to experimental work. This paper discusses a method of improving the biological properties of water. Many chemical, physical, and biological analyses were performed in the Bucharest area to determine the occurrence of Oligochaete worms in water. Results indicate the presence of Ferrobacteria such as Crenothrix, Leptothrix, Siderocapsa, etc, and Oligochaete worms such as Nais, Stylaria, and Aeolosoma. It was also found that Ferrobacteria which take their energy from iron components, constitute the substrata for the development of Oligachaete worms. Negative pipeline pressures resulting from interruptions in pumping, or excessive water use, were presumed to be associated with the problem. The worms were not found in water from catchments, treatment stations, intakes, reservoirs or pumping stations. Hydraulic and hydropneumatic washings were made to remove the crusts of iron compounds, particularly limonite, as a possible energy source for ferrobacteria. Laboratory experiments were conducted by using copper sulfate, aluminum sulfate, sodium chloride and chlorine. Later, slow and shock chlorination methods were used successfully to remove hazardous bacteria and worms from the drinking water. (Carstea-USGS)

APPLICATION OF OPTIMAL CONTROL THEORY TO A CLASS OF RIVER AERATION PROBLEMS,
RUTGERS - The State Univ., New Brunswick, N.J.
B. Davidson.
Appl Syst Anal Sanit Eng, Proc, 4th Annu, AAPSE, Workshop, Clemson Univ, p 11-1 -- 11-6, June 1969. 6 p, 7 fig.

Descriptors: *Aeration, *Optimization, *Control systems, *Design, *Pollutants, Water quality control, Analog computers, Digital computers, Stream improvement, Numerical analysis.
Identifiers: Pontryagin's Extremum Principle, Sirazetdinov-Tarassov-Perlis algorithm.

Optimal Control Theory was explained for lumped and distributed parameter systems using the artificial instream aeration problem as an illustrative example. The presentation commenced with a discussion of modern, state-space control theory for systems of ordinary differential equations followed by a statement of Pontryagin's Extremum Principle. The algorithm was then applied to the optimal design of steady-state, artificial aeration for polluted rivers. Distributed parameter optimization and the Sirazetdinov-Tarassov-Perlis algorithm was then presented and its application to the unsteady-state or optimal start-up aeration problem was discussed. Examples of numerical problems were given. Both analog and digital computers were used in obtaining optimal results. (Thiuri-Cornell)

DITTMAN V NAGEL (BREACH OF WARRANTY OF WELL WATER).

168 NW 2d 190-196 (Wis 1969).

Descriptors: *Wisconsin, *Potable water, *Water pollution, *Wells, Consumptive use, Water quality, Bacteria, Water pollution sources, Legal aspects, Judicial decisions, Remedies, Damages, Relative rights.
Identifiers: *Warranty.

Plaintiff brought action to recover damages for an alleged breach of an express warranty that a well on property purchased from defendants produced an adequate supply of water fit for human consumption. At trial, plaintiffs testified that when they took occupancy on May 30, 1965, the well was producing polluted water. Defendants testified that the well water was safe up to and including May 28, 1965, the day they moved from the premises. The trial court awarded damages and defendants appealed. The appellate court reversed on the grounds that the evidence didn't support the verdict. The court agreed that the warranty was binding as to both the quantity and quality of the water. However, the court held that a warranty to be breached must be breached at the time of sale. The date of sale most favorable to the plaintiffs was May 7, 1965. No evidence was presented to prove the water was polluted at any time before May 30, 1965. The burden of proof is on the party relying on breach of warranty to show the breach of that warranty. Plaintiffs did not meet that burden. (Gabrielson-Fla)

DEBATE ON THERMAL ISSUE CONTINUES.

Environmental Science and Technology, Vol 3, No 5, p 425-427, May 1969. 3 p.

Descriptors: *Thermal pollution, *Water pollution effects, *Waste water treatment, *Legal aspects, Power plants, Cooling towers, Lagoons, Public utilities, Construction costs.

Identifiers: *Water Quality Improvement Act, *Federal Power Commission, Columbia River Study, Connecticut River Study.

Thermal pollution control problems are discussed with reference to pending legislation. Water treatment projects by public utility industries are deterred because of their cost which is estimated at $1.8 billion dollars in 5 years. These companies are funding studies of water pollution effects, however. Larger and more concentrated heat loads are predicted with substantiating data. Columbia and, lticut River Studies are preparing mathematical models of the biological effects of heat loading. Licensing of the plants may soon require compliance with water quality standards to be decided by state agencies. Various cooling facilities are described with examples of existing construction. Cost is dependent on the choice of the system and cannot be generalized for: cooling lagoons, cooling towers, mechanical draft (forced or induced blower systems), natural draft. (Sherman-Vanderbilt)

COMMONWEALTH V NEW YORK AND PENNSYLVANIA CO. (EQUITABLE RELIEF FROM STREAM POLLUTION).

367 Pa 40, 79 A 2d 439-448 (1951).

Descriptors: *Pennsylvania, *Pollution abatement, *Industrial wastes, *Water pollution, Judicial decisions, Legal aspects, Remedies, Water law, Rivers, Public health, Administrative decisions, Water pollution control, Regulation, Abatement, Water quality control, State governments.
Identifiers: *Public nuisance.

Plaintiff, the Commonwealth of Pennsylvania, brought an action to abate a public nuisance created by the discharge of industrial wastes into the Clarion River. The lower court denied relief upon the grounds that the Sanitary Water Board under the Pure Streams Act of 1937 had exclusive control to determine public nuisances resulting from stream pollution. The plaintiff appealed. It was clear that defendant had polluted the Clarion River to the detriment of public health. Their actions were being reviewed by the Sanitary Water Board when plaintiff sought equitable relief. On appeal plaintiff gained relief. The court held that it was not the purpose of the 1937 act to supplant former or future actions in equity to abate public nuisances in streams. The strong public policy of the state was to abate public nuisances and the 1937 act only supported the equitable or common law remedies. When the public waters were corrupted by pollution a determination by the Sanitary Water Board that such was a public nuisance was not a pre-requisite to obtaining equitable relief. (Holt-Fl a)

SIZING UP ANTI-POLLUTION LEGISLATION,
Laurence W. Ross.
Chemical Engineering, Vol 74, No 15, p 191-196, July 17, 1967. 6 p, 18 ref, 2 tab.

Descriptors: *Water Quality Act, *Water quality control, *Water pollution, *Standards, Air pollution, Analytical techniques, Pollutants, Water pollution control, Water pollution effects, Pollution abatement, Color, Acidity, Turbidity, Bacteria, Industrial wastes, Water supply, Water types, Domest ic water, Potable water, Recreation facilities, Wildlife, Water util ization, Federal government, Federal-state water rights conflicts, Legislation, Chemical wastes, Legal aspects, Industries.

This country is faced with pressing problems from both air and water pollution. The Wat er Quality Act of 1965 is a good focal point for discussion regarding water pollution. Under that act the states are required to establish standards acceptable to the Department of the Interior or the Department will set the standards. Federal authority is to be invoked only if the states do not act. The state standards must include specific criteria and a plan for enforcement. The plan will be evaluated with respect to various types of water supplies and requirements. The criteria established by the states must be general enough to allow the states to respond to technological advances. The criteria should cover bact eria, dissolved oxygen, pH, and temperature, and be dependent on the anticipated water use. The 'Water Quality Criteria' is an excellent basis for evaluation of chemical plant discharges. The specialty industries such as food and textile are the most vexing to the authorities who must establish the criteria. Color and turbidity present the biggest problems of water pollution. The timetables for enforcement will allow older industries that cannot reform ample time to terminate. (Shevin-Fla)

AIR POLLUTION, WATER POLLUTION, INDUSTRIAL COOPERATION AND THE ANTITRUST LAWS,
Philip K. Verleger, and Jennie M. Crowley.
Land and Water L Rev, Vol 4, No 2, p 475-486, 1969. 12 p, 34 ref.

Descriptors: *Pollution abatement, *Water pollution, *Industrial wastes, *Federal government, Water pollution treatment, Legislation, Industrial plants, Water utilization, Control, Operations, Standards, Social aspects, State governments, Legal aspects, Judicial decision, Regulation, Competition.

In order to effectively abate industrial pollution, cooperation is needed among the industries both in the fields of research and operation. This cooperation may possibly bring these industries into direct conflict with Federal Antitrust laws. These regulations may be used to attack industry for conspiring in violation of the Sherman and Clayton Acts even if there is an effort on the part of industry to collectively agree to engage in certain practices which would aid in reducing pollution. In order for the problem of pollution to be solved, cooperation among competitors in industry must take place, and there must be added cooperation f rom state and federal government. Industries are regulated by government and there is a basic constitutional right among the regulated to collectively discuss the demands of the regulator. State and federal legislation dictate rules for the industry as regards pollution; however, the industrys' right to discuss collectively their ideas of this problem must be protected and not be allowed to fall prey to antitrust legislation. (Shevin-Fla)

WHAT PRICE A QUALITY ENVIRONMENT,
Jack W. Carlson.
Journal of Soil and Water Conservation, Vol 24, No 3, p 84-88, May-June 1969. 5 p, 2 ref.

Descriptors: *Cost-benefit analysis, *Pollution abatement, *Future planning (Projected), *Project benefits, Public benefits, Pollutants, Air pollution, Water pollution control, Costs, Long-term planning, Environment, Cost analysis, Cost trends, Cost-benefit ratio, Management.

Attempting to abate pollution implies that environmental quality goals have been assessed. Goals must vary with cost, and cost of quality control must not exceed the damage inflicted. Costs and benefits, then, must be measured. Benefits are often difficult to measure because we lack adequate environmental quality or social indicators. There are problems with determining the nature of human well-being, measuring aesthetic and health benefits, and projecting benefits into the future for future generations. Costs of improvements are easier to measure than benefits, but analysts should be wary of using simple calculation methods. All of the new data that are now available must be utilized in order to prevent inflated cost estimates. A recent federal study found that costs were much lower than expected. Costs to industry are only a fraction of one percent of the added. Consumers could finance abatement similar fraction of annual income. Manageme environmental quality is extremely important this can best be done if management institu can encompass the location where they orig and cause damage. (Douberley-Fla)

IVER CONSERVANCY DISTRICTS.
Ann Stat ch 42, secs 383, 392a, 394, 401, 403, 4, 409 (Smith-Hurd 1956), as amended, (Supp 69).

escriptors: *Illinois, *Administrative agencies, Water conservation, *Pollution abatement, gislation, Water law, Legal aspects, Jurisdiction, ater pollution control, Highways, Taxation, Prots, Judicial decisions, Political aspects, Water sources, Water utilization, Ditches, Sewers, Assments, Construction, Financing, Channels, ds under water.
entifiers: Conservancy districts, Special assessents.

henever unified control of a lake or river system comes necessary, a conservancy district may be rmed after approval of a petition presented by a specified number of voters to the circuit court and upon approval in a general election of qualified voters within the proposed district. The board of trustees of any conservancy district has certain enumerated powers and duties so that it may carry out its assigned corporate functions. The district may const ruct sewers, channels, and ditches along or under highways and may establish necessary pipes and conduits on the beds under the surface of state waters. The board is charged with prevention of pollution within its jurisdiction and may appoint a sufficient police force to enforce laws relating to this duty. Special assessment and general taxation are the two methods by which district projects are financed. The board is specifically charged with seeing that parties responsible for pollution cease activities which are the cause thereof. (See also W69-09126 thru W69-09128). (Johnson-Fla)
W69-09125

RIVER CONSERVANCY DISTRICTS.

Ill Ann Stat ch 42, secs 383, 392a (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Illinois, *Administrative agencies, *Water conservation, *Water utilization, Flood control, Pollution abatement, Legislation, Legal aspects, Water law, Jurisdiction, Political aspects, Water pollution, Water pollution control, Sewage, Water supply, Drains, Ditches, Sewers, Bridges, Eminent domain, Electric power production, Construction, Bridge construction, Condemnation, Maintenance.
Identifiers: Conservancy districts.

Whenever unified control of a lake or river system or a portion thereof is deemed conducive to the prevention of stream pollution, control or prevention of floods, disposal of sewage or provision of domestic, industrial or public water supplies one per cent of the legal voters may initiate a petition for the formation of a river conservancy district. Such petition must be brought before the circuit court which passes upon its necessity after a public hearing. If approved by the court, a general election of the voters in the proposed district is held in which a majority of those voting must approve the formation of the district. The powers and duties of the board of trustees include the cleaning out, widening, or deepening of any drain, sewer, river, pond or water course, constructing and maintaining ditches, sewers and canals, constructing and enlarging bridges in the district, and holding, purchasing or condemning real or personal property, but not furnishing water power or electricity for private use or otherwise. (See W69-09125). (Johnson-Fla)
W69-09126

RIVER CONSERVANCY DISTRICTS.

Ill Ann Stat ch 42, secs 394, 401, 403 (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Illinois, *Water utilization, *Water conservation, *Water pollution control, Administrative agencies, Legislation, Legal aspects, Water law, Recreation facilities, Wildlife habitats, Water supply, Regulation, Water sources, Dams, Reservoirs, Water purification, Pumping, Pipelines, Costs, Sewers, Ditches, Drains, Highways, Construction.
Identifiers: Public waters.

The board of trustees may acquire land for use in construction of parks, recreational areas, wildlife areas and water supply. It may adopt and enforce regulations relating to protection of water sources as well as build dams and reservoirs for water storage, water purification works, pumping stations and pipelines for production and delivery of pure water to consumers. The board must sell water at rates that will at l east defray all fixed, maintenance and operating expenses and profits from such sale must be used for extention and improvement of water facilities. Each district may construct, maintain, and extend its sewers, pipelines, ditches and drains along or under highways, streets or alleys and may operate conduits and pipes, wholly or partially submerged, under the public waters of the state provided that permission for same is granted by the governor and that normal use of the waterbody is not impeded thereby. The board has the duty to prevent pollution of the water supply and may appoint and support a sufficient police force for same with jurisdiction not only within the district but also to as far as fifteen miles from the intake of such water supply. (See W69-09125). (Johnson-Fla)
W69-09127

RIVER CONSERVANCY DISTRICTS.

Ill Ann Stat ch 42, secs 404, 409 (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Illinois, *Pollution abatement, *Water conservation, *Water utilization, Drains, Sewers, Laterals, Legislation, Water law, Water policy, Construction, Taxes, Sewage disposal, Administrative agencies, Jurisdiction, Water pollution control, Assessments, Financing.
Identifiers: Special assessments, Shore improvements, Sanitary dist-icts.

Construction of drains, sewers or laterals, septic tanks, water pipes, local shore improvements and dams and improvement of channels, beds and banks may be initiated by the board of trustees. Such projects may be financed by special assessment or general taxation. The board may contract with any sanitary district for sewage disposal within the conservancy district. Special assessments must be made in relation to the benefit gained by such projects; however, they may not be applied on property wholly outside the district. It is a primary duty of the board to see that pollution within the district is prevented and such board must cause all persons, parties, firms and corporations to cease pollution of all waters within the state, provided that in so doing the board does not supersede the authority of the Sanitary Water Board of the State of Illinois or its successor. (See W69-09125). (Johnson-Fla)
W69-09128

CHEMICAL CONTAMINANTS FOUND IN SURFACE AND SUBSURFACE WATER AS RELATED TO SOIL AND CLIMATIC CONDITIONS.
Maine Univ., Orono.

Project Completion Report, Maine Water Resources Center, August, 1969. 28 p, 17 tab. OWRR Proj A-006-ME.

Descriptors: *Insecticides, *Water quality, *DDT, *Endrin, Runoff, Sediment.
Identifiers: *Endosulfan.

Runoff was collected from plots maintained under various cropping systems. Samples were separated as to sediment and water and analyzed for pesticides and various elements. Pesticides were analyzed by electron capture gas chromatography whereas inorganic chemical elements were analyzed by atomic absorption and colorimetry. The concentration and amounts of endosulfan, endrin and DDT were lower in runoff from a rotation system of potatoes, sugarbeets and peas than from continuous potatoes. The amounts of insecticides in runoff were small compared to the amount applied. Less than one percent of the amounts applied were received in runoff. The concentration of the insecticides were considerably higher in the soil or sediment fraction of the runoff. A study on the retention of insecticides on two soils suspended in water showed that the insecticides tend to concentrate in the 0.08-0.5 mu clay fraction. The retention of the insecticides studied differed for the two soils studied. The intact Marshall soil retained more of each insecticide than the Caribou soil probably because of the higher organic matter content. In the clay fraction the retention was higher in the Caribou soil even though there is less organic

matter than in the Marshall. (See also W69-09229).
W69-09228

CHLORINATED INSECTICIDES IN RUNOFF WATER AS AFFECTED BY CROP ROTATION,
Maine Univ., Orono.
E. Epstein, and W. J. Grant.
Soil Science Society of America Proceedings, Vol 32, No 3, p 423-426, May-June 1968. 4 p, 6 tab, 20 ref.

Descriptors: *Pesticides, Erosion, *DDT, *Endrin, Gas chromatography.
Identifiers: *Endosultan.

The concentration and amounts of three chlorinated insecticides were lower in runoff from a rotation system of potato (Solanum tuberosum L.), oats (Avena sativa L.), and sod, than under continuous potato cropping. Runoff samples from natural runoff plots were collected following each storm, and the amounts of DDT, endrin, and endosulfan were analyzed with a gas chromatograph. The amounts of pesticides in runoff were small compared to the amount applied. The concentrations of the insecticides in the runoff (soil-water suspension) were generally greater than those found in the settled soil (sludge). (See also W69-09228).
W69-09229

ELECTRIC UTILITIES INCLUDE BUILT-IN SAFEGUARDS FOR ENVIRONMENTAL PROTECTION.

Environmental Science and Technology, Vol 3, No 6, p 523-525, June, 1969.

Descriptors: *Thermal pollution, *Air pollution, *Water pollution, *Waste treatment processes, Electric power plants, Engineering structures, Cost comparisons, Cooling towers, Reservoirs.
Identifiers: *Gilbert Associates Inc, *Keystone Power Station, *Homer City Power Station, *Conemaugh Power Station.

The design, cost, and efficiency of pollution control faci lities in the building of electric power plants is discussed in three sections: Water, ai r, thermal aspects. The three stations concerned are mine-mouth plants in Pennsylvania, Keystone (two 900 mw units), Homer City (two 640 units), Conemaugh (two 900 mw units). Water demand is reduced in the new plants by cooling towers, recirculating systems and storage reservoirs used to augment low flow streams in the summer and also as a neutralizer. New protection devices (oil skimmers, diversionary dams and ditches, and manhole appurtenances) were used to keep oil spillage from contaminating the streams. Electrical precipitators (95% efficiency) were used to control fly ash and high stacks were designed to avoid ground level concentration of SO2. Air quality levels are being tested at all three plants. Large electric stations can be located on small streams without pollution hazards if designed with water storage and hyperbolic natural draft types. Large cooling towers are the most economical of all systems. (Sherman-Vanderbilt)

NATURAL DISPLACEMENT OF POLLUTION FROM THE GREAT LAKES,
Oak Ridge National Lab. Tenn.
Robert H. Rainey.
Science, Vol 155, p 1242-1243, Mar 10, 1967. 1 fig, 1 tab, 3 ref.

Descriptors: *Great Lakes, *Model st udies, *Flow rates, *Eutrophication, Pollutants, Water pollution.
Identifiers: *Natural displacement.

A simplified mathematical model of a lake system (assumptions of equal flow rate to and from the lake, constant concentration of pollutants in streams entering the lake constant rate of pollution and distribution of pollutants in lake volume) indicates that if the pollution of the Great Lakes were discontinued, the natural flow through the lower Great Lakes would be sufficient to remove about 90 percent of the waste in about 20 years. On the other hand, hundreds of years would be required to displace the pollution from Lake Michigan and Lake Superior. Although the mathematical relationship ignores many factors influencing the contamination of lakes, it is a close representation of the lower Great Lakes because of their relative shallowness. Quantitative data is diagrammed. (Sherman-Vanderbilt)

A NEW CRITICAL PHASE OF THE LAKE WASHINGTON POLLUTION PROBLEM,
Washington Univ., Seattle. Dept. of Sanitary Engineering.
R. O. Sylvester.
Trend Engineering, Washington Univ, Seattle, Vol 8, p 8-10, Apr 1956. 2 fig, 7 ref.

Descriptors: *Water pollution sources, *Water pollution control, *Pollution abatement, Water supply, Sewage treatment, Washington, Eutrophication.
Identifiers: *Lake Washington, Sewer outfalls, Combined sewer systems, Lake fertilization, Aquatic plant nuisance, Effluent diversion, Nutrient reduction, Metropolitan Sewage Planning Agency, Washington, King County, Snohomish County, Seattle, Mercer Island, Bellevue Sewer District, Duwamish River.

Lake Washington, with approximately 38 square miles of surface water, is situated in the Seattle metropolitan area and supplies drinking water to 15,000 people. In addition to natural runoff from the urban area, outfall sewers from the metropolitan area discharged into the lake until 1941. Seattle's sewage is now diverted and treated outside the area, eventually reaching Puget Sound. However, combined sanitary and storm sewers frequently overload and mixtures of sanitary and storm sewage flow into the lake. Since 1941, ten additional treatment plants have been constructed which discharge treated effluent. Principal sources of lake pollution now are: (1) inflowing waters at north end, (2) overflows from Seattle's combined system, (3) septic tank leachates, and (4) overloads of treatment plants along shoreline. These sources still supply enough nutrients to cause a serious nuisance at some seasons. The solution may involve one, or a combination, of the following: (a) formation of a metropolitan sewerage planning agency, (b) complete elimination of sewage discharge by pumping all effluents to Puget Sound, (c) research on interrelationships between water temperature, algal growth, and nutrients to determine conditions under which increased nutrients could be tolerated without causing an extreme nuisance environment. (Ketelle-Wis)

WATER-QUALITY MANAGEMENT AND LAKE EUTROPHICATION: THE LAKE WASHINGTON CASE,
Washington Univ., Seattle. Dept. of Zoology.
W. Thomas Edmondson.
Water Resources Management and Public Policy, Washington Univ Press, Seattle, p 139-178, 1968. 2 fig, 1 tab, 104 ref.

Descriptors: *Lakes, *Eutrophication, *Sewage effluents, *Nutrients, *Nitrogen, Phosphorus, Sulfates, Vitamins, Algae, Growth rates, Copper sulfate, Bottom sediments, Lake Michigan, Washington, Dissolved oxygen.
Identifiers: *Effluent diversion, *Water quality management, *Lake Washington, *Sewage fertilization effects, *Biological productivity, Aquatic nuisances, Transparency, Agricultural runoff, Nutrient budgets, Comparative studies, Nutrient removal, Lake recovery, Wisconsin, Lake Monona, Lake Mendota, Lake Waubesa, Lake Kegonsa, Lake Zurich, Oscillatoria rubescens, Cladophora, Dinobryon divergens, Switzerland, Lake Lucerne, Lake Constance, Washington, Puget Sound, Bare Lake (Alaska), Lake Lyngby So (Denmark), Lake Tahoe (Calif), Lake Maggiore (Italy), Species dominance.

Lake Washington's case parallels other lakes worldwide where cultural eutrophication has led to increased biological productivity, limiting water uses. First definite indication of enrichment appeared in 1955 with abundance of Oscillatoria rubescens, followed by reductions in transparency and dissolved oxygen levels in water. Present solution to the problem has been almost total diversion of effluents from the lake, completed in 1967 at a cost of $85 million (including new treatment facilities). Evidence of the role of sewage in fertilization and lake deterioration comes from many sources: direct observation; urbanization followed by symptoms of increased lake productivity; nutrient budget studies, indicating relative nutrient percentages from different sources; comparison of similar lakes in different environments; changes resulting from sewage effluent diversions around lakes; bioassay techniques of lake water samples; and physiological studies of algae grown in nutrient solutions. The relative importance of various nutrients and maximum allowable concentrations in lakes are dependent on several interrelated factors including diverse effects of different combinations of nutrients, and variety in reactions by species to nutrients. Improved methods of nutrient removal from sewage will undoubtedly develop, but at present, effluent diversion is the only sure method of controlling enrichment of lakes. (Ketelle-Wis)

THE USE OF DYNAMIC PROGRAMMING IN REGIONAL WATER QUALITY PLANNING,
Clemson Univ., S.C.
B. C. Dysart, III.
Appl Syst Anal Sanit Eng, 4th Annu, AAPSE Workshop, Clemson Univ, p 10-1 -- 10-23, June 1969. 23 p, 3 tab, 14 fig.

Descriptors: *Dynamic programming, *River basins, *Optimization, *Pollution abatement, *Water quality control, Streamflow, Biochemical oxygen control, Dissolved oxygen, Reaeration, Treatment facilities.

Dynamic programming techniques were used to demonstrate the process of modelling a river basin for quality control. The objective of the research was to determine the least total cost treatment level or abatement policy required at each outfall to meet specified water quality standards. Only a single type of waste, biochemical oxygen demand, was considered. Consideration was given to the effects of changes in the system parameters such as streamflow, reaeration and deoxygenation rate coefficients and dissolved oxygen standards, on the basin cost and abatement policy. The procedure was found to be equally applicable for any other waste type for which transport or dissipation models existed. (Thiuri-Cornell)

SOME STOCHASTIC MODELS FOR WATER QUALITY CONTROL,
Cornell Univ., Ithaca, N.Y.
Daniel P. Loucks.
Appl Syst Sanit Eng, Proc, 4th Annu, AAPSE Workshop, Clemson Univ, p 2-1 -- 2-11, June 1969. 6 p, 9 fig.

Descriptors: *Stochastic processes, *Water quality control, *Waste water treatment, *Markov

rocesses, *Optimization, Streamflow, Flow augentation, River basins, Design criteria.

n application of stochastic models to problems of ater quality control was discussed. The objective f the model was to determine the least cost cominations of waste water treatment and flow augentation required to maintain a specified stream uality. A Markov process was used as the basis of me stochastic optimization models for estimating e cost resulting from the imposition of probaistic flow augmentation requirements for wnstream water quality control. Given the inimum-cost function for various flows and their robabilities, the 'design' streamflow as well as the egree of waste water treatment at each source of aste within a river basin could be simultaneously xamined to determine the least cost combination f waste water treatment and flow augmentation equired to maintain specified water quality stanards. OR BETTER POLLUTION CONTROL.
extile Industries, Vol 133, No 6, p 65-69, 1969. 5

escriptors: *Textiles, *Biochemical oxygen deand, *Water pollution sources, Activated sludge, emical wastes.
entifiers: *Starch, *Textile wastes, Textile sizes, arboxymethyl cellulose, Polyvinyl alcohol, yestuffs.

rticle based on staff interview at Industrial Waste aboratory, Wesleyan University, Middletown, nn. It is maintained by Conn. Water Resources mmission. The trend from cotton and wool to an-made fibers in past 15 years has reduced water llution. Examples: Cotton mill previously eraged 100-200 lb BOD/1000 lb cloth, now out 50 lb. Starch size being replaced by carboxethyl cellulose (CMC) and polyvinyl alcohol (PA); acetic acid by ammonium sulfate; soaps by odegradable detergents; 50-100 gal water/lb th dropped to 3 to 10 gal. Most textile treatment ants remove 90% plus BOD and 50-80% of color $1.00 to $4.00/1000 lb cloth by activated sludge ocess. Effluent is often treated with chlorine and flocculant may be used in tertiary treatment. Article recommends four steps to textile plant facing pollution problem: (1) Employ a knowledgeable consultant; (2) Make a BOD survey and chemical process balance; (3) Reduce water usage and amount of high BOD chemicals. It is emphasized that the textile mills should work with municipalities to develop mutually advantageous cooperative systems of waste disposal. Constant care is needed in the use of new chemicals to prevent unexpected pollution problems. (Work-NC Stat Univ)

FOND DU LAC METROPOLITAN SEWERAGE DISTRICT V CITY OF FOND DU LAC (ESTABLISHING A SEWAGE DISTRICT).

166 NW 2d 225-230 (Wis 1969).

Descriptors: *Wisconsin, *Sewage districts, *Pollution, Judicial decisions, Sewage systems, Legal aspects, Urbanization, Public health, Cities, Local governments, Sewage disposal, Taxes, Administrative agencies, Legislation.
Identifiers: *Metropolitan sewer district, *Annexation.

The department of resource development ordered plaintiffs to solve their pollution problem. Plaintiffs, to avoid annexation by the defendant city, petitioned the courts to establish a metropolitan sewerage district. A state statute authorized such establishment upon a showing of need and fulfillment of procedural requirements. The defendants opposed this petition since it meant the furnishing of city facilities to town residents who paid no city taxes. The defendant argued that the statute was an unconstitutional delegation of legislative authority. The court found for the defendant. The court would have to answer 'What will be best.' and 'What should be.' in implementing the statute. These were clearly questions of policy that should be left to the legislature. Thus, the court felt that the statute was an unconstitutional delegation of legislative authority. The court did not decide the constitutionality of the districts, but only the method of their establishment. (Gadd-Fla)

Identifiers: Water resources management techniques.

In the last ten years a formidable array of analytical tools has been developed in an attempt to manage water resources and water quality problems. In the past, each of these tools has come about as the result of a specific study directed at a specific set of problems. In order for the planners and managers to derive the maximum benefit from these past developments, an orderly classification scheme may be used to relate the specific conditions and problems of a region to the existing body of analytical tools, including mathematical models and computer simulations. In addition, the classification scheme permits an organizational outline for structuring the types of studies required in water resources and water quality management. (Knapp-USGS)

A GAME THEORY APPROACH TO THE PROBLEMS OF INTERNATIONAL RIVER BASINS,
Harvard Univ., Cambridge, Mass.
Peter Rogers.
Water Resources Research, Vol 5, No 4, p 749-760, Aug 1969. 11 p, 3 fig, 4 tab, 9 ref.

Descriptors: *Optimization, *Optimum development plans, Linear programming, Mathematical model, Multipurpose development, Water Management (Applied), Flood control, Systems analysis, Simulation.
Identifiers: *Optimizing models, *Game theory, Lower Ganges, Brahmaputra.

The lower Ganges and the Brahmaputra rivers flow out of India and join together in the province of East Pakistan to form one of the major river systems in the world. Each year the rivers flood during the monsoon, causing loss of life and great damage to crops and property. The problem is futher excerbated by the fact that the best flood control points in the basin are not under the political control of Pakistan, which suffers most from the floods. The number of possible combinations of structural and non-structural variables for this river system is so large that conventional methods of analysis are inadequate. We demonstrate that by use of systems analysis techniques, including linear programming and game theory, we are able to consider a rational plan to control the floods while taking advantage of the possibilities for multi-use projects including flood control and other uses for the river, such as power production, irrigation, navigation, and salinity control. Moreover, using the concepts of game theory we are able to investigate a range of strategies for cooperation between the two riparian nations which will result in significant benefits to each. DAILY STREAMFLOW SIMULATION,
Sacramento State Coll., Calif.
Kip Payne, W. R. Neuman, and K. D. Kerri.
J Hydraul Div ASCE, p 1163-1179, July 1969. 17 p, 2 tab, 15 fig, 19 ref.

Descriptors: *Streamflow forecasting, *Simulation analysis, *Markov processes, *Regression analysis, *Optimization, Water quality control, Flood routing, Flow measurement, Hydrographs, Gaging stations, Monthly, Peak flow.

A daily multiple-station streamflow simulator was developed using a first order Markov chain and regression analysis. The study employed streamflow simulation techniques to get optimal flood regulation and routing for water quality control and fisheries during low flow periods. Historic flow records on the Calapooia River in Oregon were analyzed and the hydrographs rearranged to reduce the observed variations of flow within any particular day and between each day. Rearrangement of flows consisted of distributing the monthly peak or peaks of the hydrographs about particular days in order that the ascension and recession curves of the arranged flows occurred on particular days. Daily flows were simulated on the basis of the statistical properties of the rearranged flows. A dampening factor was introduced into the simulator for the purpose of producing non-historic flow sequences with statistical distributions similar to the historic distributions for the annual flows. California.

A dynamic programming model in which exist capital capacities and available primary resour served as constraints was developed. It was appl to the problem of water resources developmen the State of California in a general equilibri analysis which considered all sectors of the eco my simultaneously. The objective of the study to determine an optimum program of trade and vestment, including investment in water resou systems. The Leontief Model analytical techni was employed and the period from 1955 thro 1961 was studied in order to allow comparison actual performance of the economy. The m striking finding was that despite the high rate economic growth (6.6 per cent annual rate growth in state income) the economically effici water supply was practically stagnant. The exist capacity of the medium-cost water-supplying dustry was not utilized at all and at times (19 1959) even the low cost water supply capacity not fully exploited. (Thiuri-Cornell)

Identifiers: The Chain of Lakes.

A simulation model based on flooding on the Ch of Lakes (Grass, Fox, Nippersink and Pistak Lakes) and the assessment of flow diversion Lake Michigan as a means of reducing flo damages was developed. The study was directed the evaluation of water export as a means for c trolling floods on a small lake system. Stocha flood simulations were based on the history of l level fluctuations and an estimate of the st volume relationship for the lakes. The lake d was reduced to probability distributions and flo generated by Monte Carlo (random number) sa pling techniques. A generated large flood sequer was selected for sensitivity analysis of divers capacity and overflow elevation. The flood p reduction results with changing diversion size w exhibited. The hydrographs showed that a sm change in diversion size would not appreciat alter the flood peak. The use of General Purp Systems Simulation language facilitated the c struction of the computer model for simulation lake flooding and diversion. (Thiuri-Cornell)

t Ass Sci Hydrol, Symp Haifa, p 401-412, March 67. 12 p, 5 fig, 4 ref.

escriptors: *Optimization, *A quifer charac- ristics, *Groundwater recharge, *Distribution tterns, *Markov processes, Pumping plants, anning, Mathematical models, Constraints.

athematical programming techniques were em- oyed to establish the criterion of 'optimal yield' ther than 'safe yield' for planning the utilization groundwater aquifers. The planning criterion s the maximization of the objective function sub- t to all constraints involved. The problem of unning the groundwater utilization was formu- ed with this criterion. The proposed approach s introduced through the analysis of a simple odel representing a homogeneous strip of a astal aquifer, which included a pumping and harge installation. The problem of the optimal eration of the system during a given number of te units was presented as a conditional planning oblem. Once the rules of the optimal operation of system for the various seasons as well as the ini- l conditions were known, it was possible to com- te, using a deterministic model, all future states the system. The distribution functions could be ewise computed using a stochastic model incor- rating Markov chains. Quantities of water to be mped and recharged in the future could be ilarly estimated. Descriptors: *Linear programming, *Dynamic programming, *Simulation analysis, *Optimization, *Aquifer characteristics, Mathematical models, Subsurface waters, Water resources development, Annual costs, Design criteria.
Identifiers: Southern California, Indus Valley, Israel.

The application of linear programming, non-linear programming, dynamic programming and simulation techniques for determining least cost operation rules for the coordination of surface and subsurface water resource facilities was presented. Three examples of aquifer management using systems approach in Southern California, in the Indus Valley and in Israel were given. In Southern California simulation techniques were used for the derivation of operating policies. For the Indus Valley mathematical models were constructed for the various components of a complex hydro-agronomic system. These models were evaluated through simulation. In Israel a sequential decision problem was analyzed using dynamic programming. In all cases, however, the aquifers were viewed as components of complex water resource systems. Their utilization was optimized within the overall system. In two of the examples (Indus Valley and Israel) quality considerations weighed heavily in the derivation of design criteria on operation rules. (Thiuri-Cornell)

This paper emphasizes the need to consider social institutions and cultural diversity in the development of world water resources. Understanding of human behavior requires focusing on both the people-in-action or the system of action and the blueprint for behavior or the culture of the people. Most social institutions have both an integrative function and a boundary maintenance function. For water resource development the closeness of the unity between the territoriality of the people-in-action and the spatial availability of the water affects the success of the water development scheme. The waterspace concept states that for each economic development scheme, careful and detailed study must be made of the territorial and cultural aspects of the social institutions involved. A case history of waterspace is traced in the development of the Salt River Valley of Arizona. Several other examples are provided from culturally divergent and geographically widespread areas. The importance of cultural factors is shown in examples from the water development problems of several countries. Successful economic development is enhanced where careful consideration is given to the territoriality of the existing and created social institutions. The blueprint for behavior of people occupying a given waterspace must complement demands of development. (See W69-09210). (Sherbrooke-Ariz)

HISTORICAL BACKGROUND AND PHILOSOPHICAL BASIS OF REGIONAL WATER TRANSFER,
Idaho Univ., Moscow. Water Resources Research Inst.
C. C. Warnick.
IN W.G. McGinnies and B.J. Goldman, Eds., Arid Lands in Perspective, p 340-352, University of Arizona Press, Tucson, 1969. 13 p, 6 fig, 1 tab, 62 ref.

Descriptors: *Water transfer, *Inter-basin transfers, Arid lands, Southwest U.S., Distribution patterns, Import, Irrigation canals, Water conveyance, Water demand, Water distribution (Applied), Arizona, California, Future planning (Projected), Projected benefits, Projected planning, Human population, Social aspects, Federal jurisdiction, History, Colorado River.

It is concluded that a regional water transfer, although difficult to define, does entail out-of-basin diversion and has a noticeable impact on the socio-economic well being of the area. An historical review, beginning 6,000 yrs. ago in the Near East, concludes with descriptions of the Colorado River Aqueduct and the Rocky Mountain Trans-mountain Diversions. Population increase, economic growth and the solution of the Arizona Valley Cal., et al case related to Colorado River water allocation has resulted in development of many conceptual plans for rather vast regional water transfer. Information on these projects has been summarized in a table. The philosophical justification for regional water transfer is discussed in terms of the following: (1) regional growth and economic expansion, (2) social welfare, (3) wisdom of visionary leaders, (4) agencies ambition and (5) professional challenge. Present authorities advocate more study and are seeking more alternatives for the solution of water needs in arid-land regions. Time required for planning and accelerated technological change make it difficult to reconcile the problem of water needs at hand. (See W69-09210). (Sherbrooke-Ariz)

ECONOMICS OF LARGE-SCALE TRANSFERS,
Resources for the Future, Inc., Washington, D.C.
Charles W. Howe.
IN W.G. McGinnies and B.J. Goldman, Arid Lands in Perspective, p 374-382, University of Arizona Press, Tucson, 1969. 9 p, 4 tab, 20 ref.

Descriptors: *Interbasin transfers, *Cost-benefit analysis, Water transfer, Arid lands, Export, Import, Cost comparisons, Project planning, Water costs, Long-term planning, Project benefits, Short term planning, Comparative costs, Cost-benefit theory, Direct benefits, Direct costs, Economic evaluation, Economic justification, Estimated benefits, Indirect benefits, Indirect costs, Agriculture, Irrigation water.

Current projects of interbasin transfer of water differ from past projects by increased size and higher potential for conflict between exporting and importing regions. This paper sets out to answer the questions, 'Are total social benefits from the transfer sufficient to offset the total costs,' and 'Will water users be able and willing to pay a price for water which will cover project costs'. Empirical studies show direct benefits to be fairly low compared to prospective costs of new water supplies. This implies that the economic feasibility of new supplies will depend upon indirect benefits and that user charges sufficiently high to cover the costs of providing the water will probably not be possible. Secondary benefits are analyzed and the possibility that they are balanced by secondary disbenefits is considered. Empirical studies of total benefit show that the period of immobility is a crucial factor which must be studied carefully. The costs of several proposed large-scale transfers are presented. Estimates of costs and benefits suggest that large-scale transfers are at best marginal for all areas at present, but that their use in providing water for already established, highly specialized agricultural areas which will be exhausting their

water supplies in an area of potential application. (See W69e09210). (Sherbrooke-Ariz)

PHILOSOPHICAL CONSIDERATIONS OF WATER RESOURCE IMPORTATION,
Dean F. Peterson.
IN W.G. McGinnies and B.J. Goldman, Eds., Arid Lands in Perspective, p 398-405, University of Arizona Press, Tucson, 1969. 7 p, 18 ref.

Descriptors: *Water transfer, *Ethics, *Water allocation (Policy), Arid lands, Interbasin transfers, Decision making, Local governments, Social values, Water resources development, Water pollution effects, Political aspects, Political constraints, Legal aspects, Social aspects, Conservation.
Identifiers: Philosophical considerations.

This paper is concerned with two related topics; (1) the ethical dimensions of the concepts of minimizing man's interference with nature in constrast to his desire to conquer nature, and (2) the ethical concepts related to our historical water policies and their relation to the concept of large-scale water transfer. The man-nature theme vs. conquest of nature and the ethics of pollution problems are discussed. The history of U.S. water policy, a reflection of philosophy, is traced. Political equity and income redistribution are discussed in relation to policy formation. Benefits from water importation are considered in terms of regional differences in states of development. The importance of real objectives (vs. procedures) and sovereignty is related to water decision making. General solutions based on ethical considerations do not appear possible, but every effort should be made to construct and debate ethical arguments in both generalities and for specific cases so that our decisions might be the best possible. CANADIAN WATERS AND ARID LANDS,
Department of Energy, Mines and Resources, Ottawa (Ontario).
E. Roy Tinney, and Frank J. Quinn.
IN W.G. McGinnies and B.J. Goldman, Eds., Arid Lands in Perspective, p 411-415, University of Arizona Press, Tucson, 1969. 5 p, 2 tab, 3 fig.

Descriptors: *Water transfer, *Water policy, United States, Interbasin transfers, Water resources development, Legal aspects, Economy, Governments.
Identifiers: *Canada.

This paper attempts to present Canadian thinking and positions on the possibility of international large-scale transfer of Canada's water resources. It is emphasized that no official contact has been made between governments on this subject and that all water authorities in the U.S. are not convinced of the need for international diversion. Some of the major points in Canadian thinking are: (1) Canadian waters are a national, not a continental, resource; (2) no market presently exists for Canadian water in the U.S.; (3) Canada would be unwilling to sell water until completion of an inventory of its own future needs; (4) Canada is presently inventorying water resources; (5) both federal and provincial governments in Canada must concur on any negotiations; (6) sale conditions could not jeopardize permanent ownership and repatriation if and when needed in Canada. It is apparent that the question of exporting Canadian water to the U.S. arid lands is premature: quite simply, there is no buyer and no seller. (See W69-09210). (Sherbrooke-Ariz)

THE ROLE OF THE ECONOMIST,
Oregon State Univ., Corvallis. Dept. of Agricultural Economics.
Bruce R. Beattie.
IN W.G. McGinnies and B.J. Goldman, Eds., Arid Lands in Perspective, p 416-417, University of Arizona Press, Tucson, 1969. 2 p, 4 ref.

Descriptors: *Water transfer, *Decision making, *Economic evaluation, Interbasin transfers, Economic prediction, Economic impact, Economic justification.

This paper discusses the role of the economist in the social decision-making process and how the economist, given the present state of his art, might best fulfill this role with regard to the issue of interbasin water transfer. The economist is obligated to provide positive analysis of the economic implications of alternative social actions and to be careful not to imply or leave the impression that the optimum arrived at, given the technical criteria of economics, has any more or less normative significance regarding the total problem than do optima of other technical disciplines. It is the economist's role to act as an expert consultant to decision-makers, but he can not replace decision-makers. The key economic variables in water transfer are the value productivity of water in the area of destination, the value productivity of water in the area of origin, and the cost of transfer. In addition to recounting the direct and indirect effects, an evaluation of effects due to changes in product and factor prices and determination of proportionate share of the Federal tax burden will be required to provide a complete description of regional income redistributive impacts of water transfers. (See W69-09210). (Sherbrooke-Ariz)

IS PUBLIC INTERVENTION IN WATER RESOURCE DEVELOPMENT CONDUCIVE TO ECONOMIC EFFICIENCY,
John V. Krutilla.
Natural Resources Journal, Vol 6, No 1, p 60-75, Jan 1966. 16 p, 1 tab.

Descriptors: *Economic efficiency, Welfare (Economics), Water resources development, Cost-benefit analysis, Administrative agencies, History.
Identifiers: Income redistribution, Research needs.

The paper reviews the history of propositions in welfare economics which have become firmly established in concept and practice. It raises questions regarding their applicability at this stage in the development of water resources. Public intervention, while necessary, may not be sufficient to improve efficiency in government agencies. Benefit-cost analysis is supposed to provide criteria by which intervention can improve efficiency. However, benefits are typically overstated by the benefit-cost calculation. Income redistribution attending a project should be considered in terms of efficiency but traditionally has not been. The efficiency of the institutional mechanism of public intervention is analyzed. The more established an agency is, the more traditional its goals and approaches are likely to be. A community's growing needs may surpass the capability of its agencies. Pressing research needs include a review of the capabilities of existing agencies, identification of the barriers to improved performance, and consideration of the problem of organizing a capability consonant with present and future needs. Models for study include the cooperative water quality management associations in the Ruhr and the integration of investment planning, design criteria and pricing policy of Electricite de France. MUNICIPAL WATER SUPPLY AND RECREATION: ARE THEY COMPATIBLE,
Colorado Univ., Boulder.
Ralph A. Graham.
Water Development Utilization, Conservation, Western Resources Conference, Boulder, Colo, 31-35, 1963. 5 p.

Descriptors: *Multiple-purpose reservoi *Recreation, Water quality, Water supply.
Identifiers: *Community relations, *Citizen's a visory groups.

In response to the question posed, the case of S Diego, California is cited as an example of a situ tion where the two uses have been found to compatible. The author admits, however, to t possibility of this not being true in other jurisdi tions. The present reservoir recreation program San Diego utilizes each of the two impoundi reservoirs in the city's reservoir system. Activiti include fishing, waterfowl hunting, picnicking, hi ing and camping but water contact activities su as swimming, wading and water skiing a prohibited. A program involving such an importa part of the community as its water supply reservo has many community relation problems. The Ci of San Diego has taken a three facet approach solving these problems: (1) appointment of an a visory group of respected citizens to a City Lak Recreation Commission; (2) appointment of a sp cialist in fish and game matters to the city's utiliti department staff; and (3) hard work on the part everyone from the city manager down to t newest laborer to insure a successful reserv recreation program. This includes maintaining good relationship with all of the news media a maintaining good public relations with all t public agencies and citizen's organizations. (Sta Chicago)

The Broadway Lake Commission manages and controls Broadway Lake in Anderson County and those park areas in and near said lake. The Commission, with the aid of the county supervisor, sees to the proper improvement, maintenance and supervision of the lake area and also makes rules and regulations necessary to carry out these duties. The Commission may condemn, purchase, lease or otherwise acquire such properties as are needed to create the lake and adjacent park areas. Boathouses and walks built with Commission approval are exceptions to the general prohibition of private building on the lake edge. Fishing is governed by state law and may be done only by hook, pole, line and hook or rod, reel, line and hook. Artificial lights may not be used by fishermen to attract fish. The sheriff and his deputies in Anderson County in cooperation with the lake patrolman are responsible for keeping order around said lake. (Johnson-Fla)

Identifiers: *Great Lakes Basin Compact.

The State of Illinois does hereby ratify, approve and adopt the Great Lakes Basin Compact. The purposes of the compact include: (1) the development, use and conservation of the water resources of the Great Lakes Basin; and (2) the securing and maintaining of a proper balance among industrial, commercial, agricultural, water supply, recreational and other legitimate uses of the water resources of the basin. The compact shall be effective when enacted by any four of the participating states. A Great Lakes Commission is hereby created and shall perform enumerated powers within the Great Lakes area and any watercourse or watershed draining in any of these lakes. The Commission shall have, among its other powers, the power to: (1) correlate data relating to water resources; (2) recommend methods for developing and conserving water resources; (3) consider means of improving navigation and fisheries; (4) recommend policies relating to water resources including institution and alteration of flood plains; and (5) recommend to the party states uniform and other laws relating to the basin's water resources. Each party state agrees to consider the action the Commission recommends. Ratification and approval procedures are also provided. (Heckerling-Fla)

OPTIMIZATION OF LONG-RANGE MUNICIPAL MULTI-RESOURCE FISCAL POLICIES,
Service Bureau Corp., Inglewood, Calif.
Charles B. Woodward.
Soc Econ Planning Sci, Vol 1, No 3, p 273-282, July 1968. 10 p, 1 tab, 5 fig.

Descriptors: *Linear programming, *Metropolitan Water Dist. of So. Calif., *Optimization, *Water distribution (Applied), *Water rates, Model studies, Financial analysis, Computers, Budgeting, Interest rate, Investment.

A linear programming model was developed to assist the Metropolitan Water District of Southern California (MWD) in determining the cost of the various fiscal policies. A linear programming matrix using raw data was produced by a matrix generator. The linear programming output was translated by another computer program into budget reports to the board of directors. Two types of input data were required, (a) monetary data of current tax rates and fixed expenditure and receipts, maximum tax water rates, bond interest rates, interest rates earned on investments, and (b) model data consisting of periods, row names, vector names and fixed coefficients. Three studies were made for the MWD and two separate objective functions, minimization of cost to the citizen and minimization of total bond interest cost, were examined. Although the maximum tax rate was unacceptably high, the results obtained for minimizing total tax and water revenues were illuminating. The use of computers facilitated the task. (Thiuri-Cornell)

A MATHEMATICAL THEORY OF COST-EFFECTIVENESS,
INFRET Corp., New York.
Herman Zabronsky.
Soc Econ Planning Sci, Vol 1, No 1, p 3-18, Sept 1967. 16 p, 7 fig, 4 ref.

Descriptors: *Mathematical models, *Cost-benefit analysis, *Budgeting, *Planning, *Optinization, Resource allocation, Decision making, Input-output analysis.
Identifiers: Cost-effectiveness, Gradient Method.

A rigorous mathematical theory of cost-effectiveness, based on Gradient Method, was developed that was applied to obtain quantitative solutions to decision making problems. The problems pertained to planning, programming and budgeting systems that require precise comparison of alternate plans and programs. Cost-effectiveness analysis was used to make such comparisons by relating resource input and useful output of a program relative to stated planning goals. The proper applications of cost-effectiveness depended on their mathematical foundations. (Thiuri-Cornell)

RICE V OAKLAND COUNTY DRAIN COMM'R (ASSESSMENTS MUST BEAR RELATIONSHIP TO BENEFITS).

168 NW 2d 302-304 (Ct App Mich 1969).

Descriptors: *Michigan, *Assessments, *Benefits, *Property values, Appraisals, Evaluations, Condemnation, Compensation, Lakes, Riparian land, Judicial decisions, Legal aspects, Remedies, Water levels, Real property, Administrative agencies, Administrative decisions, Adjudication procedure.

A special assessment district was established in 1963 to fix and maintain the water level of Lower Straits Lake. The original assessment made by defendant commissioner on plaintiffs' land was $2,264.75. As the result of a petition by plaintiffs, a board of review revised this special assessment at a reduced sum of $1,265. Plaintiffs appealed to the circuit court. That court found the revised assessment to be equitable and reasonable under the circumstances. From this decision plaintiffs appealed, contending that the stabilization of the water level of the lake did not increase the value of their property since special soil conditions made the property unsuitable for the construction of buildings and residences. The court affirmed the circuit court's decision. The court agreed that an assessment to be valid must relate to the benefit which reasonably applies to the subject property. It found evidence that the board of review had taken into account the special soil conditions in revising the assessment. The court found insufficient evidence to negate the conclusion that the revised assessment accurately reflected the equitable benefit derived by the plaintiffs from the stabilization of the lake water level. IMPERIAL REFINERIES OF MINNESOTA INC V CITY OF ROCHESTER (ASSESSMENT FOR SEWER AND WATER IMPROVEMENTS).
165 NW 2d 699-703 (Minn 1969).

Descriptors: *Minnesota, *Assessments, *Sewers, Judicial decisions, Conduits, Project benefits, Cities, Water tanks, Legal aspects, Local governments, Evaluation, Taxes.
Identifiers: Water mains.

Defendant city assessed plaintiff's property for sewer and water improvements. Plaintiff appealed claiming that the failure of defendant to give notice of the final assessment made the assessment unconstitutional. Plaintiff also claimed that the city is estopped from denying that it proceeded under a repealed statute since such statute was erroneously designated by the city clerk. Finally, the plaintiff claimed that the assessments were improperly allocated. The court found for the defendant. The court decided the first contention had no merit since plaintiff's full participation in previous proceedings was sufficient notice. Even without sufficient notice, plaintiff's full hearing on the merits was held to be a waiver of any objection. Plaintiff's failure to rely on the erroneous designation was held to invalidate his second contention. The third contention was held to be without merit since the alleged improper allocation was in fact due to dissimilar benefits. In addition, property given a lower assessment was outside the city and its owners had assumed the assessment. (Gadd-Fla)

6D. Water Demand

DETERMINANTS OF PROPERTY VALUE ON ARTIFICIAL LAKES,
E. L. David, and W. B. Lord.
University of Wisconsin, Dept of Agricultural Economics, No 54, May 1969. 55 p, 12 ref.

Descriptors: *Water allocation (Policy), *Water resources development, *Recreation demand, *Artificial watercourses, Property values, Lakes, Watercourses (Legal), Value, Market value, Shores, Lake shores, Riparian land, Recreation, Wisconsin, Resources development, Resource allocation, Water demand, Water values, Access routes, Topography, Water pollution, Population, Density, Surface waters.

The public demand for water recreation areas, as measured by examining the market values of waterfront property is used as an aid to guide future water resource development. The accuracy of such a study is somewhat limited in that it only registers the demand of that segment of the population which can afford to purchase waterfront property. The authors explain the criteria for choosing the sample and for determining the property values. The patterns of the rising demand for riparian land are examined. A statistical analysis of the effect of factors influencing development is presented including an examination of land value, value of improvements, number of improvements per acre, topography, ease of access, pollution, proximity to population centers, amount of surface water in vicinity, and amount of privately owned shoreline. The data presented is summarized and conclusions are drawn. (Gabrielson-Fla)

WATER USE IN THE MINERAL INDUSTRY,
Bureau of Mines, Washington, D.C. Div. of Economic Analysis.
Alvin Kaufman, and Mildred Nadler.
Bur Mines Inform Circ No 8285, 1966. 58 p, 15 fig, 24 tab, 8 ref, 2 append.

Descriptors: *Water utilization, *Mineral industry, Mining, Sands, Gravels, Iron, Phosphates, Reclaimed water, Water reuse, Waste water treatment.
Identifiers: Mineral industry water use.

To aid industry and Government in planning water developments the Bureau of Mines in 1963 canvassed mineral producers to determine water use in 1962. Water used by the mineral industry is only 2% of the water withdrawn by all industry. The major water-using mineral industries are natural gas processing, phosphate rock, sand and gravel, and iron ore. Total water use and new water intake is dependent on the quantity of material processed and the process water requirements of the particular industry or commodity. Recirculation is dependent on the processing requirements of the particular commodity, the manner in which the water is used, cooling and condensing requirements in large industries, the quality of new water intake, and the need to treat new discharged water. Consumed water is dependent on the quantity of water recirculated, the temperature and humidity in the area, and the proportion of water used for cooling and condensing. A threefold increase in water use by the mineral industry by 1985 is forecast. (Knapp-USGS)

WATER REQUIREMENTS AND USES WYOMING MINERAL INDUSTRIES,
Bureau of Mines, Denver, Colo. Dept. of Engine ing.
Millard M. Gilkey, and Ronald B. Stotelmeyer.
Bur of Mines Inform Circ No 8328, 1967. 92 p, fig, 4 tab, 18 ref, 1 append.

Descriptors: *Water utilization, *Water requi ments, *Mineral industry, *Wyoming, Data coll tions, Water reuse, Reclaimed water, Surf waters, Waste water treatment, Water law.
Identifiers: Mineral industry water requirements.

A detailed study was made of water usage in Wyoming mineral industry, with projections for future. In 1964, the mineral industries of Wyom used 20 billion gal. of new water, nearly all self-s plied, and reused 72 billion gal, a total usage of billion gal. Consumption amounted to 2.8 bill gal. About half of the 20 billion gal of new wa was obtained from surface sources and the from groundwater. Reported costs, covering po and maintenance, for the self-supplied new wate mineral industry operations ranged from about 20 cents per thousand gal and averaged 8 ce Cost of recirculation of water, including power maintenance, averaged 2 cents. The value product for the entire industry was $25 thousand gal of new water intake and about $ per thousand gal consumed. Wyoming has a wa deficiency but the shortage is less severe than in arid Southwest. The demand for new water will crease from the 20 billion gal used in 1964 to billion gal in 1980. The projected new-wa requirement for the year 2000 is 40 billion gal. napp-USGS)

he author discusses the approaches used by vari-
s countries for handling the problems of multina-
nal river boundaries. He touches on the systems
ed by other nations and on the situation as it ex-
s between the United States and Canada. He
ates that in the area of cooperative non-naviga-
nal uses the United States-Canada experience
s become a model to be studied by Europeans.
e considers the boundary waters experience
tween these two nations as having been highly
ccessful. The author fully develops the history of
nited States-Canada relations in this area and
eorizes that resort to the international tribunals
ould not have produced such success. He feels
at these nations have progressed to a point where
ere is recognition of sharing a common continent
d the water programs of these nations have done
uch in that direction. The full ramifications of
is continentalism have not yet developed, but,
hen they do, there should be even more substan-
l continentalist policies. (Shevin-Fla)

**OMMONWEALTH V TEMPLE COAL CO.
ONSTRUCTION OF SETTLING BASIN PUR-
ANT TO BOARD ORDER).**
District and County Reports 7-25 (CP Pa 1949).

Descriptors: *Pennsylvania, *Flood control, *Streamflow, *Obstruction to flow, Judicial decisions, Settling basins, Desilting, Erosion control, Flow control, Streams, Stream erosion, Flooding, Riparian land, Riparian waters, Legislation, Banks, Bank erosion, Coal mine wastes, Mineral industry, Administrative agencies, Cost allocation.
Identifiers: Culm piles.

Plaintiff coal company owned land through which a stream flowed. Erosion of culm piles on the banks of the stream resulting from heavy rain and flooding caused ensilting in the stream and obstruction of water flow. Under an act making it unlawful to construct an obstruction so as to change the flow of a stream, the water board issued an order requiring the company to construct a settling basin on the stream to intercept flood wash and debris. The company built the settling basin and attempted to force contri bution for costs from an adjacent coal company. The court held that the act did not empower the board to direct a riparian owner to construct any work in any stream or upon his land to prevent flooding. The board's only power was to direct removal of the obstruction. The company that built the settling basin was therefore a volunteer in its actions and could not compel contribution from the other company. (Helwig-Fla)

ELKHORN COAL CORP. V YONTS (SUIT AGAINST MINERAL OWNER FOR ALLEGED DAMAGE TO WATER WELL).

262 SW 2d 384-385 (Ky 1953).

Descriptors: *Kentucky, *Mining, *Water wells, *Subsurface waters, Deep wells, Underground, Coal mines, Mining engineering, Mineralogy, Salts, Mineral water, Domestic water, Judicial decisions, Legal aspects, Civil law.

Plaintiff landowner brought suit against mineral owner for alleged damages to a water well. Plaintiff claimed that the wrongful mining operations of defendant had caused his well to go dry. On appeal the defendant contended that (1) his mineral deed gave him the right to subterranean waters; and (2) for plaintiff to sustain his claim he had to show that the mining operation was done in wanton and malicious disregard of his surface rights. The court disallowed defendant's first point by ruling that the deed which used the terms 'mineral' and 'all salt mineral waters' was not broad enough to include subterranean waters. As to defendant's second contention, the court reasoned that where at least two-thirds of the coal was left unmined, where there were no breaks in the mine roof or water leaks under the well, and where there were no cracks or cave-ins on the surface, the mineral owner was not liable for the drying up of the water well. The lower court was thus reversed because of the lack of proof showing any grossly negligent or wanton and malicious actions by defendant. (Logan-Fla)

KIDDE MANUFACTURING CO V TOWN OF BLOOMFIELD (DAMAGES RESULTING FROM STREAM IMPROVEMENTS).
20 NJ 52, 118 A 2d 535-543 (1955).

Descriptors: *New Jersey, *Stream erosion, *Flow augmentation, *Channel improvement, Banks, Bank erosion, Channel erosion, Streambeds, Cities, Stream stabilization, Natural flow, Downstream, Retaining walls, Flood control, Damages, Riparian land, Velocity, Streamflow, Judicial decisions, Construction.

Plaintiff brought this suit to recover damages caused to his property by the acceleration of the flow of water in a certain stream. Plaintiff was riparian land owner on this stream which flowed between the two defendant municipalities. As part of a flood control program defendants constructed concrete walls on the banks and concrete floor on the bed of the stream above and below plaintiff's property. This construction did not include that segment of the stream flowing through plaintiff's property. As a result of erosion of silt and gravel, a wall on plaintiff's land collapsed and a building was damaged. Plaintiff alleged the increase in stream velocity resulting from the improvements caused the erosion and resulting damages. Defendants contended that the erosion was caused by plaintiff's removal of a dam and other stabilizing elements in the stream. From a judgment for defendants, plaintiff appealed. The court held that if the cities knew or should have known that the improvements would so increase the velocity of flow as to cause erosion and damage, and took no steps to avoid that result, they would be liable for the damages. The evidence, however, supported a finding that the cities had exercised reasonable care to avoid damage to plaintiff and that the injuries complained of were the result of plaintiff's own action. CHANGING LAW FOR THE CHANGING SEAS,
Columbia Univ., New York.
Louis Henkin.
Uses of the Seas, p 69-97, (E Gullion ed 1968) 29 p, 1 fig.

Descriptors: *Law of the sea, *Oceans, *International law, *International waters, Commercial fishing, Foreign trade, Treaties, Legal aspects, Federal government, Admiralty, Navigation, Military aspects, Water law, United Nations, Continental shelf, Mining, Coasts, Boundaries (Surfaces), Exploitation, International hydrological decade.
Identifiers: *Contiguous zones, *Territorial sea.

Expanded use of the sea and its resources necessitate more enlightened thinking regarding the law of the sea and legal arrangements concerning it. The basic principle of the law of the sea is freedom. This principle and its limitations apply to the sea, the air, and the ocean floor. Coastal states have historical rights in their territorial sea, fishing zones, contiguous zones and continental shelf. Conflicting uses of the sea have forced the development of preferred and reasonable uses of the ocean area as well as international agreements. Issues and problems result from the uncertainties and inadequacies in the law. For example, the continental

shelf, as defined by international convention, is outdated by modern technology. Alternatives have been suggested. Proposals have been made for a new law of the sea as it should apply to military use, scientific research, fishing and mineral resources mining. Advantages may be found in United Nations' control of the sea and in an international authority to govern the seas. (Helwig-Fla)

LAND AND WATER CONSERVATION FUND ACT AMENDMENTS.

Hearing on HR8578 and related bills before the subcomm on National Parks and Recreation of the House Comm on Interior and Insular Affairs, 90th Cong, 2d sess, ser 90-20 (1968).

Descriptors: *United States, *Legislation, *Recreation facilities, *Water conservation, Leases, Federal governments, State governments, Local governments, Recreation, Water resources development, Real property, Resource development, Contracts, Parks, Financing, Land management.
Identifiers: *Land and Water Conservation Fund Act.

The Subcommittee on National Parks and Recreation of the Committee on Interior and Insular Affairs of the House of Representatives met to consider a bill to amend title I of the Land and Water Conservation Fund Act of 1965 and other bills to amend the Land and Water Conservation Fund Act of 1965. The bill amending title I would: (1) add for a limited time additional sources of revenue to the Fund for Federal and state property acquisition; (2) authorize the head of the department concerned to contract, under certain restrictions, for the acquisition of property in advance of the actual appropriation of funds; and (3) authorize a lease-back and sell-back land management program for property acquired by the National Park system with moneys so received being credited to the Fund. The other bills would provide only for increased revenues to the Fund in order to assist federal, state, and local governments in acquiring and developing public outdoor recreation facilities. The committee heard arguments from both sides on the passage of the bill and considered numerous statistics and letters from interested parties. (Heckerling-Fla)

DEPARTMENT OF CONSERVATION.

Minn Stat, secs 84.024 to 84.032, 84.081 to 84.111, 84.14 to 84.154 (1967), as amended, (Supp 1969).

Descriptors: *Minnesota, *Administrative agencies, *Conservation, *Project planning, Legislation, Obstruction to flow, Administration, Legal aspects, Low water mark, Water law, State governments, Boat launching ramps, Boats, Recreation facilities, Boating regulations, Fish conservation, Aquatic plants, United States, Public rights, Land tenure, Financing, Access routes, Projects.
Identifiers: *Injunctions (Prohibitory).

The creation and organization of a department of conservation is provided in this chapter. The commissioner of conservation is vested with prescribed powers and duties with respect to public lands, timber, water and minerals of the state, and records pertaining thereto. Specific responsibilities include boat safety, game and fish conservation, and recreational land project planning, including regulation of public access and boat launching facilities. The commissioner may sue to enjoin an obstruction to waterflow outside the state which affects the state. In civil actions involving navigability or ownership of beds to which the state is a party, the commissioner may stipulate the low water mark involved. The department shall have a division of waters, soils and minerals. The commissioner shall be responsible for state water projects and the sale or acquisition of land for such purposes. A Lac qui Parle and Big Stone Lake Water Control Projects Fund is hereby established. (Harris-Fla)

BRIDGES.

Minn Stat, secs 165.01 to 165.12 (1960).

Descriptors: *Minnesota, *Bridge construction, *Bridge design, *Interstate rivers, Navigable waters, Legislation, Interstate compacts, Disasters, Floods, Bridges, Mississippi River, Federal jurisdiction, Financing, Legal aspects, Local governments, Interstate, Maintenance, Operation and maintenance, Highways, Administrative agencies.
Identifiers: *Toll bridges, *Bridge specifications, Minnesota River, *Draw bridges.

Road authorities may construct and maintain bridges as necessary. All bridges shall be of minimum specified strength and of specified width if constructed subsequent to this act. Bridges of less than minimum width may be repaired or constructed under certain circumstances. The width and grade of approaches to bridges shall be as specified unless modified by the commissioner. To connect highway systems of adjoining states with this state, the road authority may acquire interstate bridges belonging to other states or private persons, and cooperate with other states in construction and maintenance of bridges. Where Congress has authorized bridges over waters between this state and an adjoining nation, the commissioner may cooperate with foreign authorities for bridge construction and maintenance of free or toll bridges. Tolls shall be collected as provided. Local governmental units may acquire bridges over navigable streams if they are 'interested' as prescribed by this act. Bridges over navigable waters or the Minnesota or Mississippi River shall be subject to special approval. All draws shall be opened on reasonable signal. Town bridges destroyed by flood or calamity shall be reconstructed as provided, and financed according to the act. (Harris-Fla)

ROADS, GENERAL PROVISIONS.

Minn Stat Ann secs 160.06, 160.19, 160.20, 160.201 (1960), as amended (Supp 1968).

Descriptors: *Minnesota, *Highways, *Roads, *Drainage, Embankments, Road banks, Transportation, Road construction, Right-of-way, Drains, Ditches, Railroads, Legislation, State governments, Construction, Permits, Legal aspects, Maintenance.

Any forest trail or portage between navigable waterbodies or from navigable waterbodies to a public highway which has been in continuous use for 15 years or more as a trail shall be deemed to have been dedicated to the public. When a road authority constructs a drainage ditch to drain a highway and the ditch crosses a railroad right-of-way, the railroad shall carry the ditch across the right-of-way. The costs shall be apportioned on the basis of benefits to each. The owner of land which drains naturally to a highway may enter the highway to connect his drain to any drain constructed along or across the highway provided he obtains a written permit from the road authority. Anyone desiring to install a drain for agricultural purposes in a natural drain on a highway being constructed, must do so while the highway is being constructed. For the purpose of draining public roads and preventing large accumulations of water in road ditches, the authorities having supervision over the roads may have the ditches cleaned or improved in order to provide proper drainage. (Helwig-Fla)

SUPERVISION OF DAMS AND RESERVOIRS.
Conn Gen Stat Ann secs 25-110 to 25-119 (1960), as amended, (Supp 1969).

Descriptors: *Connecticut, *Supervisory control (Power), *Dams, *Reservoirs, Legislation, Dam construction, Design, Water law, Legal aspects, Inspection, Permits, Administration, Safety, Administrative agencies, Control, Regulation.
Identifiers: Penalties.

The Water Resources Commission in its jurisdiction over all dams, has the power to formulate rules, delegate authority, enter private property and to consult experts necessary to carry out the provisions of this chapter. The commission inspects dams which they deem unsafe and, if found to be unsafe, they may require owners to either make them safe or to remove them. The owners may then be required to make periodic inspections. The commission must issue a permit for any dam to be constructed. All dams, while under construction shall be inspected by the commission to determine whether they will be safe and secure. If this inspection is passed, the commission shall issue a certificate of approval to the dam owner. No order approval or advice by the commission shall act to relieve any dam owner from liability resulting from ownership or operation. Violation of any provision of this chapter or order of the commission is punishable by a fine of $500 a day. Any person aggrieved by a decision of the commission is entitled to a hearing before the commission and an appeal to the superior court. (Holt-Fla)

Descriptors: *Maryland, *Tidal waters, *Wildlife, *Fisheries, Anadromous fish, Commercial fish, Herrings, Fish barriers, Fish food organisms, Fish hatcheries, Fish migration, Fish passages, Fish stocking, Dams, Nets, Fish handling facilities, Administrative agencies, Boats, Streams, Riparian rights, Recreation, Explosives, Natural resources, Creeks, Legislation, Regulation, Civil law, Fish conservation.
Identifiers: Chesapeake Bay.

All laws respecting the regulation of size and sale of fish shall apply to those caught in the waters of the state or those caught outside the state and brought into it. The Tidewater and Inland Fishing Commissions shall inspect the waters of the state and may erect and maintain hatcheries where suitable. It is unlawful to place obstructions at the mouth of any stream or cove which would prevent the fish therein from having free passage. All dams must contain at least one fish ladder suitable for allowing fish to have a free course up and down at all times. It shall be unlawful to use dynamite in any stream except for bona fide engineering, milling, or mining purposes. It shall be unlawful to thresh streams for the purpose of driving fish into nets. No boat shall be anchored in any fishery during the herring season. Any boat sailing through a net lawfully placed in the waters shall be guilty of a misdemeanor and liable for the damages it causes. Riparian owners have first rights to conduct a commercial fishery in the waters in front of their property. (Shevin-Fla)

ATLANTIC STATES MARINE FISHERIES COMPACT.

Md Ann Code art 66C secs 256 thru 261 (1957).

Descriptors: *Maryland, *Interstate compacts, *Marine fisheries, *Atlantic Ocean, Shellfish, Anadromous fish, Marine fish, Commercial fishing, Sport fishing, Regulation, Legislation, Administrative agencies, Fish conservation, Fisheries, Fishing, Fish management, Interstate commissions, Governors.

ne provisions of the Atlantic State Marine Fishe-
es Compact are set out. The purpose of the com-
act is to promote better use of Atlantic seaboard
sheries through development of a joint program.
he compact will become effective whenever two
the listed Atlantic states have executed it. Each
gnatory state is to appoint three representatives to
interstate commission which shall ascertain
ethods to conserve marine, shell anadromous
sheries. The commission shall draft and recom-
end legislation to the various states, advise ad-
inistrative agencies as to problems of fisheries
d recommend stocking programs. The federal
sh and wildlife service of the department of the in-
rior shall act as research agency for the commis-
on. An advisory committee of commercial fisher-
en and salt-water anglers shall be set up to advise
e commission. Each member state agrees to con-
ibute to the support of the commission in propor-
on to the value of its fisheries' products. Each
ate initially agrees to contribute an amount based
on the catch record of 1938. Subsequent budgets
ill be recommended by a majority of the commis-
on. The governor of Maryland is authorized to ex-
cute the compact on behalf of Maryland. The
laryland commission members are the director of
e Department of Tidewater Fisheries, a legislator
ho is a member of the commission on interstate
operation, and a private citizen appointed by the
overnor. (Shevin-Fla)

NATURAL RESOURCES CONSERVATION.

Del Code Ann tit 7, sec 6001 (Supp 1966).

Descriptors: *Delaware, *Water policy, *Resource development, *Water resources, Governments, Administrative agencies, Legislation, Legal aspects, State governments, Federal government, Local governments, Water resources development, Conservation, Wildlife conservation, Natural resources, Administration, Multiple-purpose projects, Planning, Water conservation, Water utilization, Regulation, Control, Long-term planning, Programs, Water supply.

The public policy of this state shall be the development, utilization, and control of all water, underwater and air resources for the maximum beneficial use of its people. Such resources are to be developed and controlled by the Water and Air Resources Commission which is charged with carrying out said public policy. Of special concern to the legislature are: (1) assurance of adequate supplies of these resources for domestic, industrial, power, recreational, and other beneficial uses; (2) regulation and development of water resources in general; and (3) protection and conservation of water, underwater and air resources, for public recreation, and for conservation of wildlife and aquatic life. Programs to initiate and conduct research in these areas and to foster cooperation with federal, state, and local governmental agencies are established by this section with the aim of carrying out the above enumerated policies of the state. (Johnson-Fla)

BOARDS OF DITCH COMMISSIONERS; FORMATION OF A TAX DITCH: PROCEDURE.
Del Code Ann tit 7, secs 4106-4143 (1953), as amended, (Supp 1966).

Descriptors: *Delaware, *Administrative agencies, *Drainage programs, *Drainage districts, Legislation, Local governments, Ditches, Adjudication procedure, Decision making, Administrative costs, Cost sharing, Taxes, Assessments, Costs, Flood protection, Compensation, Damages, Right-of-way, Feasibility studies, Cost-benefit analysis, Investigations, Project planning, Legal aspects, Public rights, Watershed management.
Identifiers: Tax ditches.

Any person can petition the superior court, through the County Soil Conservation District, for the establishment of a tax ditch. A tax ditch is a government subdivision organized to construct a drainage system to drain lands or protect them from flooding. The petitioner must use a particular form and deposit a sum for administrative costs of processing the petition. The soil district through investigation and hearings shall determine the feasibility of the proposed tax ditch. If the district determines the tax ditch is feasible then the ditch commissioners of the county concerned shall make determinations as to the construction needed, the boundaries of the watershed, the permanent rights-of-way needed, the damages to private property, the compensation for improvements already constructed, and the estimated cost of all work to be done. The resident associate judge of the county shall appoint the ditch commissioners and they may get aid from the state drainage engineer. The commissioners shall also compile an assessment list of all affected landowners for distribution of costs. A public hearing of all affected landowners is to be called by the commissioners to obtain opinions and objections on the commissioners' findings. A report of these findings including the results of a referendum of the property owners shall be sent to the superior court. The court shall hold a final hearing and decide on the tax ditch based upon the benefit to the public, the report of the commissioners and the referendum. (Gadd-Fla)

ATLANTIC STATES MARINE FISHERIES COMPACT.

Del Code Ann tit 7, sec 1501-1505 (1953).

Descriptors: *Delaware, *Interstate compacts, *Fish conservation, *Fish management, Fisheries, Fish stocking, Anadromous fish, Atlantic Ocean, Fish harvest, Fishing, Commercial fishing, Sport fishing, Costs, Administrative agencies, Regulation, Federal government, State governments, Financing, Interstate commissions, Legislation, Legal aspects.
Identifiers: Department of the Interior.

The governor shall execute the Atlantic States Marine Fisheries Compact with any of the Atlantic seaboard states or states contiguous thereto with waters frequented by anadromous fish. The agreement shall have for its purpose the better utilization of fisheries through a joint protection program. Each state shall appoint three representatives, one to be the executive officer of the state agency concerned with fisheries, one a legislator, and one a private citizen, to the Atlantic States Marine Fishe-

ries Commission. The Commission shall have power to: ascertain methods to prevent depletion of fisheries; recommend methods for coordination of police powers; recommend regulations to proper state agencies; and recommend to party states the stocking of waters with fish or fish eggs. The Fish and Wildlife Service of the federal Department of the Interior shall act as the primary research agency for the Commission. A committee of commercial and sport fishermen shall be appointed to advise the Commission in its recommendations. Each state shall make appropriation to the Commission in proportion to the market value of its fishery products as well as an initial stated contribution. Pursuant to the compact the three members of the Commission from Delaware are appointed. (Kahle-Fla)
W69-09087

CONSERVATION--FISHING IN CERTAIN WATERS.

Del Code Ann tit 7, sec 1101-1124 (1953), as amended, (Supp 1968), secs 1125-1130 (Supp 1968).

Descriptors: *Delaware, *Freshwater fish, *Sport fishing, *Fish management, Fish conservation, Legislation, Regulation, Fishing gear, Pollution, Fish stocking, Nets, Bass, Carp, Pikes, Walleye, Eels, Herrings, Permits, Water pollution control, Seasonal.
Identifiers: Shad, Penalties (Civil), Limits.

Game and certain other fish are protected by regulations set out in this chapter. Various open seasons are provided, with a closed season on herring after June. Minimum legal sizes are set out, and daily limits allow a catch of 6 for most varieties. Game fish may only be taken by hook and line under immediate observation of the fisherman. Nets and other devices are generally prohibited in freshwater, except for minnow nets and dip nets. Nongame fish may be taken by net with a permit. Nets may be used in tidal waters with some exceptions. No season is provided for carp, and they may be taken with nets in meadows and ditches. Net fishing is prohibited on Sunday and shad fishing on Saturday and Sunday. Specific regulations provide for particular fish, bodies, devices, and non-residents. Pollution is prohibited that causes damage to fish life. Penalties for violation of these regulations are provided. Provisions are made for a freshwater trout stamp, the proceeds from which are used for restocking trout. (Douberley-Fla)

ROSE V STATE (APPROPRIATION OF RIPARIAN RIGHTS).

24 NY 2d 81, 298 NYS 2d 968-978 (1969).

Descriptors: *New York, *Riparian rights, *Alteration of flow, Riverbeds, Competing uses, Diversion, Industrial water, Obstruction to flow, Water loss, Judicial decisions, Legal aspects, Appropriation, State government, Compensation, Damages, Factories, Water utilization.
Identifiers: *Chenango River, Chenango, Broome County.

Plaintiff owned two corporations engaged in processing and selling gravel, sand, stone, and concrete from plants located on property abutting the Chenango River. The water source was necessary due to the quantity of water required in the manufacturing process. The state of New York changed the riverbed from the area in which the corporation maintained their water intake line. The corporation was forced to relocate its plants. Plaintiff sued for compensation for the destruction of the corporate riparian rights. The court held that where the state takes property, the owner must be indemnified, insofar as possible, and the owner was entitled to compensation for injuries to the business' assets. The state was liable for moving fees or the difference between salvage and reproduction cost less depreciation, which ever amount was smaller. (Moulder-Fla)

PAY STATE LOBSTER CO., INC. V PERINI CORP. (DAMAGE CAUSED BY DREDGING).

245 NE 2d 759-760 (Mass 1969).

Descriptors: *Massachusetts, *Dredging, *Lobsters, *Permits, Judicial decisions, Contracts, Silts, Water pollution effects, Water circulation, Intake structure, Commercial fishing, Water pollution sources, Commercial shellfish, Damages.
Identifiers: United States Coast Guard, Negligence.

Plaintiff sued for damages caused by defendant's dredging of Boston Harbor which raised silt and killed plaintiff's lobsters. Defendant had been warned but continued dredging. The attachment of extension pipelines to the lobster tanks' intakes would have alleviated the problem. Defendant had the technical competence to install the pipes and it would have been inexpensive in relation to what defendant would receive for the dredging. Defendant only attempted to install one pipeline after ten days of dredging. Plaintiff did not have the technical competence to install the pipelines and could not have had t hem installed for three or four months. These facts warranted a finding of negligence against the defendant. Defendant was not relieved of his negligence by his contract for the dredging with the United States Coast Guard nor by his license from the Department of Public Works. (Gadd-Fla)

KEATOR V STATE (CONDEMNATION RIPARIAN PROPERTY).

23 NY 2d 337, 244 NE 2d 248-250 (1968).

Descriptors: *New York, *Condemnation va *Riparian land, *Recreation facilities, Condem tion, Damages, Adjudication procedure, Land Riparian rights, Delaware River, State gove ments, Land appraisal, Construction co Depreciation, Compensation, Property valu Legal aspects, Judicial decisions, Value.

Plaintiff's property, located on the Delaware used as a clubhouse and meeting place, was c demned by the state. Plaintiff was awar $15,900. The first appellate court reduced award to $12,000 holding that the trial court inc rectly added building reproduction costs to l value without any suggestion that the property either unique or a specialty. This court, on app by the plaintiff, reinstated the trial court's awa Just compensation should normally be determi by fair market value, but fair market value, in t must be based upon the highest and best use of property. Since the evidence showed that the use of this property was as a clubhouse, it could termed a 'specialty' and as such was not suscepti to the rule of fair market value. An award based the current cost of reproduction less depreciat was proper. (Kahle-Fla)

QUISITION OF LANDS AND CONDEMNA- ON THEREOF.

Code Ann secs 59-221, 59-222, 59-224 (1962).

Descriptors: *South Carolina, *Condemnation, *Cities, *Water supply, Right-of-way, Legislation, Streets, Public health, Dams, Canals, Lakes, Pollution abatement, Drainage, Drainage systems, Compensation, Land tenure, Streams, Operation and maintenance, Municipal water, Watershed management, Surface runoff, Surface drainage, Drains, Surface waters, Legal aspects, Local governments.

Cities and towns may purchase and hold suitable lands and water and erect aqueducts, dams, canals, and other such works as may be necessary to obtain and secure a supply of water. The city shall have the right to condemn: (a) any lands, the drainage from which would contaminate the water supply of the city; (b) such streams and lakes as may be required for the water supply; and (c) rights-of-way in order to operate aqueducts, dams, and canals. Just compensation shall be paid as provided for by law. Any municipal corporation desiring to establish or extend waterworks may condemn water rights and water privileges. Such corporation may also condemn lands for the purpose of protecting watersheds from contamination, nuisances, or any condition menacing to public health. Proper compensation shall be made. If surface water is carried off from any street or public thoroughfare, such municipality shall provide sufficient drainage for the surface water through open or covered drains in such manner as to prevent passage of the wat er over private lands. However, if such drains cannot be had along such thoroughfares, the municipality may obtain a right-of-way through the private lands for the necessary drains. (Heckerling-Fla)

MICHIGAN STATE HIGHWAY COMM'N. V MCLAUGHLIN (CONDEMNATION VALUES AND SPECULATIVE BENEFITS).
167 NW 2d 468-470 (Ct App Mich 1969).

Descriptors: *Michigan, *Condemnation, *Condemnation value, *Damages, Benefits, Eminent domain, Ponds, Right-of-way, Borrow pits, Remedies, Legal aspects, Judicial decisions, Administrative agencies, Property values, Real property.

Plaintiff Michigan State Highway Commission instituted proceedings to effect the condemnation of a portion of defendants' land for the construction of part of an interstate highway. Plaintiff also asked for the right to construct a temporary road on defendants' property and the right to remove sand, gravel, and earth for highway construction purposes. Plaintiffs claimed defendants should not receive any compensation because the benefits to defendants' property exceeded the damage. The claimed benefits accrued when the excavation left a pond which plaintiffs argued could be developed into a resort, though admittedly only at considerable expense. When the trial court instructed the Commission to calculate the value of the borrow by using either units of cubic yards or acres and to take into consideration any benefits accruing to the land in determining damages, defendant appealed. The court remanded because of improper instructions to the Commission. To promote consistency in determining the value of a borrow, the valuation must be based on the actual number of cubic yards taken. Furthermore, it is improper in weighing damages to take into account those speculative benefits which could only be obtained by expensive alterations on preparations. (Gabrielson-Fla)

Descriptors: *New Hampshire, *Wildlife management, *Fish conservation, *Fish management, Legislation, Water law, Water policy, Legal aspects, Control, Regulation, Permits, Conservation, Fish, Fish establishment, Fish harvest, Administration, Fishing, Water utilization, Water sports, Hunting.
Identifiers: Possession limits.

Fishing, unless otherwise permitted, may be done only by angling. Certain devices are absolutely prohibited. These include snatch hooks, spears and grapling hooks. No living fish or fry may be imported into the state or released into the state's waters without a proper permit. Possession of fish out of season is prima facie evidence of unlawful taking by the possessor and all fish illegally taken must be seized by conservation officers. Transportation of up to two days limit on fish is authorized by this chapter with the special limitation that fish shipped by common carrier must be properly marked as set out in this section. When there is a danger of starting fires, the governor and council may, upon joint recommendation, declare any or all woodlands closed to hunters, fishermen, and trappers. Upon a proper hearing certain waters may be closed to public use to protect a crop of ice while it is being formed, cut and harvested. Foreign hunt clubs must be incorporated in the state before they may acquire any property in the state. (Johnson-Fla)

LOBSTERS AND CRABS.

NH Rev Stat Ann secs 211:18-211:45 (1964), as amended, (Supp 1967).

Descriptors: *New Hampshire, *Lobsters, *Crabs, *Regulation, Control, Shellfish, Inspection, Legal aspects, Legislation, Water policy, Permits, Commercial shellfish, Crustaceans, Commercial fishing, Conservation, Fish conservation, Trapping.
Identifiers: Licenses.

To take crabs and lobsters within the state one must procure a special license, and before receiving such license one must show proof that he has resided within the state for at least five years immediately preceding his application. The five-year resident requirement may be waived in case of a resident who does not at any time use more than five lobster traps. Female lobsters carrying spawn must be marked and immediately returned to the water. Lobsters so marked must be returned to the water if taken again. It is illegal to possess, sell, or transport lobsters if less than 3 1/8 inches in length. Lobster and crab traps must be clearly marked with the owner's initials and properly buoyed. A conservation officer may board any vessel, and such vessels' crews may not throw any materials overboard upon noticing his approach; such officer may inspect without a search warrant upon reasonable cause to suspect a violation of this chapter. Both retail and wholesale dealers in crabs and lobsters must obtain a proper license for same. (Johnson-Fla)

POWERS OF CONSERVATION DISTRICTS AND SUPERVISORS.

NH Rev Stat Ann sec 430-B:9 (1968).

Descriptors: *New Hampshire, *Soil conservation, *Land management, *Flood control, Adoption of practices, Financing, Erosion control, Legislation, Legal aspects, Water law, Administrative agencies, Administration, Natural resources, Soil stabilization, Soil management, Land, Land development, Land reclamation, Sediment control, Flood damage, Projects, State governments, Federal government, Resource development, Planning.
Identifiers: *Conservation districts.

The conservation districts and supervisors thereof have the power to conduct surveys, investigations and research relating to the character of soil erosion, floodwater and sediment damages and land drainage as well as to promote conservation and development of soil, water and related natural resources. Such research may not be initiated by any district except in cooperation with the state or federal government in order to avoid duplication. Demonstration projects and preventive control measures may be carried out by such districts which will furnish certain financial aid therefore. The districts are authorized to acquire real and personal property in this regard and may manage federal property located therein. The districts also may furnish written reports, machinery and fertilizer to land occupiers within their jurisdiction. Each district should develop comprehensive plans for the development and conservation of soil within its bounds. Before receiving benefits from the district, landowners may be required to contribute money, materials or land for the purposes outlined herein. (Johnson-Fla)

NEGLECT OF TOWN TO BUILD HIGHWAYS OR BRIDGES.

Vt Stat Ann tit 19, secs 571-574, 631-636, 640-647 (1968).

Descriptors: *Vermont, *Bridge construction, *Administration, *Local governments, Legislation, Legal aspects, Water law, Bridges, Civil engineering, Jurisdiction, Financing, Planning, Regulation, Political aspects.

When a town fails to build a bridge as mandated by the supreme or county court the original petitioners for same may apply for a fine to be assessed against the town in an amount sufficient to build such a structure. The money thus received is applied to such construction under the direction of a court appointed commissioner provided, that if the bridge is discontinued, the court may order the money to be returned to the town. Either by petition of freeholders or agreement of the selectmen bridges may be constructed between two towns and the expense apportioned as they agree. When selectmen fail to take action on a freeholder petition resort may be had to the county court on application of twenty or more freeholders. The court appoints three disinterested freeholders who hold a hearing to determine the necessity of such a bridge and the appropriate expenses to be borne by each town. A report of their findings must be filed with the court which may order the building of such bridge. (Johnson-Fla)

INTRASTATE, INTERSTATE, AND INTERNATIONAL LEGAL AND ADMINISTRATIVE PROBLEMS OF LARGE-SCALE WATER TRANSFER,
Department of the Interior, Washington, D.C. Office of the Solicitor.
Edward Weinberg.
IN W.G. McGinnies and B.J. Goldman, eds., Arid Lands in Perspective, p 352-358, University of Arizona Press, Tucson, 1969. 7 p.

Descriptors: *Interbasin transfers, *Water law, Legal aspects, Southwest U.S., Export, Water transfer, Water conveyance, Water management (Applied), Administrative agencies, Coordination, Water allocation (Policy), Jurisdiction, Negociations, Project planning, Administrative decisions, Water law, Federal-state water rights conflicts, Legislation, Interstate.
Identifiers: Canada, North American Water and Power Alliance, Colorado River Basin Project Act.

Some of the major legal developments in the U.S. concerning large-scale transfers of water between basins are discussed. In particular the Colorado River Basin Project Act of 1968 is considered. One major problem of transfers revolves around the apprehension of the people of the area of origin as to how the project might inhibit what they believe to be their opportunities for long term economic growth. The 10 yr. moratorium on studies of importations into the Colorado River basin allows focus of attention on alternatives. The North American Water and Power Alliance proposal serves as an illustration of the international legal problems developing from large scale water transfer. Several of these are discussed and some questions are posed. The diversity of agencies responsible for the U.S. governments planning, construction, funding and operation of water resources projects is compared to the advantages and disadvantages of one centralized authority. It is concluded that the diversity of interests represented by the many agencies is a good guarantee of development approaching the optimum. (See W69-09210). (Sherbrooke-Ariz)
W69-09216

DELAWARE RIVER BASIN COMPACT.

Del Code Ann tit 7, sec 6501, art 1, 2, 3, 11, 13, 14 (Supp 1966).

Descriptors: *River basin development, *Interstate compacts, *Water utilization, Water resources development, Water allocation (Policy), Water distribution.
Identifiers: *Delaware River Basin, INCODEL.

The Interstate Commission of the Delaware River Basin (INCODEL) replaced numerous federal and state agencies in exercising authority over the basin. The governors of the parties--Delaware, New Jersey, New York, Pennsylvania, and a federal commissioner are members; each member has one vote. The Commission develops and effectuates plans, policies and projects relating to water resources of the basin. A comprehensive plan for immediate and long-range development and uses is supplemented by an annual water resources program to meet estimated needs. All federal, state and local projects are cleared through the Commission and are not approved unless consonant with the comprehensive plan. Waters may be allocated among the signatory parties, and the Commission may impose conditions, obligations and requirements related thereto. Broad powers extend to all projects, research and changes for use of facilities, and include eminent domain. INCODEL has corporate powers with the commissioners acting as governing body and an executive director as administrator. Rules and regulations may be enforced under state penal sanctions and, in the absence of such statute, by a fine of from $50 to $1000. (Douberley-Fla)
W69-09267

DELAWARE RIVER BASIN COMPACT.

Del Code Ann tit 7, sec 6501, art 4-7 (Supp 1966).

Descriptors: *River basin development, *Interstate compacts, *Water utilization, Pollution abatement, Water allocation (Policy), Flood control, Flood plains, Watershed management, Assessments, Cost-benefits analysis.
Identifiers: *Delaware River Basin, INCODEL.

INCODEL has the power to develop water use and to control it by storage and release, without interference from signatories. Stream regulation may be provided, and the user benefitted thereby may be assessed for the improvements. The Commission cannot engage in the business of distributing water. It may investigate water pollution and operate projects to control and abate it. Rules or works may be established to protect public health or to preserve the waters, and orders may be issued to restrain violation, or INCODEL may file complaints with other pollution abatement agencies. The signatories agree to legislate to prevent pollution, and the compact will not inferfere with state jurisdiction. INCODEL may plan, design, and operate projects for flood damage reduction, and set up standards for the use of land which is subject to flooding, notwithstanding inconsistent state regulations. It may establish encroachment lines on flood plains and is empowered to acquire this land to minimize flood hazards and to pose hazard warnings. INCODEL promotes watershed management, but is not to operate a facility if other agencies are available to do so. (Douberley-Fla)

WATERCOURSES--RECREATIONAL USES FOR WATER UNDER PRIOR APPROPRIATION LAW,
Willis H. Ellis.
Natural Resources Journal, Vol 6, No 2, p 181-185, Apr 1966. 5 p, 18 ref.

Descriptors: *Recreation, *Prior appropriation, Judicial decisions, Colorado, Water rights, Market value, Legislation.
Identifiers: *Colorado River Conservation District.

In 1935, the Colorado River Conservation District was legally granted the power to preserve sufficient waters for public recreation. However, when it tried to employ this power in 1965, the Colorado Supreme Court denied the District its water right. This article evaluates the action of the court and the provision for water recreation in Colorado. Western prior appropriation water law allows water rights to be sold apart from land. Ideally, this type of market allocates water to the highest economic uses available in the area. A major blind spot in this system is recreation, which has economic value for the entire area but has no one to bid for it. The District, originally empowered to set some waters

apart from the market, had insufficient guidelines for evaluating recreational uses and for selecting the amount and location of recreational waters. The article concludes that, to achieve a balanced water economy, the Colorado legislature should try again to legislate extra-market protection of some natural resources. This time, however, it should specify the means by which the agency is to choose the amount and location of the water to be withdrawn. (Gossen-Chicago)

DELAWARE RIVER BASIN COMPACT.

Del Code Ann tit 7, sec 6501 (Supp 1966).

Descriptors: *River basin development, *Interstate compacts, *Water utilization, Recreation, Hydroelectric plants, Withdrawal, Water shortage, Facilities, Hydroelectric power.
Identifiers: *Delaware River Basin, INCODEL.

INCODEL shall provide for the development of water related public sports and recreation facilities, but it shall operate such facilities only in the absence of other suitable agencies. It regulates contracts for recreation facility concessions and recommends standards for their operation. Waters may be impounded and facilities may be authorized or operated by the Commission for generation of hydroelectric power. Facilities may be provided for transmission of power, but INCODEL is not authorized to sell such power to consumers. Withdrawals and diversions may be regulated and areas designated as 'protected' or 'emergency' in the event of a water shortage threat. Use may be restricted to permits issued by the Commission. INCODEL sets up cost and reimbursement formulas for the parties and adopts an annual budget with payment schedules. It may also borrow money or issue tax-free bonds up to 6% interest. (Douberley-Fla)

Government roles in basic water research,
Colorada Univ., Boulder.
Gordon L. Allott.
Water Development Utilization, Conservation, 5th Western Resources Conference, Boulder, Colo, p 3-8, 1963.

Descriptors: *Interstate commissions, *Federal-state water rights conflicts, *State jurisdiction, Research and development, Water resources development.

Offered is an alternative to federal dominance in the field of water resources research. The author suggests the use of interstate compacts as bases for research and development. While these compacts have so far largely been concerned with division of the waters in interstate streams, the author contends that the mechanism of an interstate compact can be used for planning and administering comprehensive development of an interstate stream. An interstate river commission is seen as being a more appropriate agency to plan and administer river basin development than an all-federal agency because it maintains the decision-making process within the area where the decision must be made and because each state's water problems is somewhat different from the other state's water problems. GRANT OF EMINENT DOMAIN; EXCEPTION AS TO MILLS AND WATER POWERS.
NC Gen Stat sec 62-183 (1965).

Descriptors: *North Carolina, *Eminent domain, *Condemnation, *Public utilities, L egislation, Legal aspects, Compensation, Utilities, Competing uses, Electric power, Reservoirs, Water distribution (Applied), Ponds, Dams, Powerplants, Hydroelectric power, Diversion, Mills, Public benefits.

Certain public utilities are authorized to take such lands by eminent domain proceedings as may be necessary for the establishment of reservoirs, ponds, dams, works, railroads or powerhouses. In addition, there is granted the right to divert the water from such ponds or reservoirs and conduct the same by flume, ditch, conduit, waterway, or pipeline to the point of use for the generation of power. However, such diverted water must be returned to its proper channel after being used. There is no authorization to interfere with any mill or powerplant under construction or in present operation or to take water powers with adjacent land necessary for their development. Certain mills, except cotton mills, presently in operation may be condemned upon a showing that a hydroelectric plant will benefit the public more than the continued existence of the presently operating mill. Identifiers: Penalties (Civil), Limits.

This is a comprehensive article detailing the line fishing and netting laws applicable to the waters of the Delaware River and its tributaries in the state of New Jersey. The article, in its various sections, establishes seasons for netting, handline fishing, and rod and line fishing for game and food fish. Bag limits, minimum sizes and maximum weights are prescribed for many varieties of fish, along with the setting of seasons during which various fish may be taken. Many of the sections within the article, particularly those dealing with the use of nets in taking fish, and closed laws for fishing, state that any person violating the provisions of a section shall be subject to fine and forfeiture of boats, nets and other appliances used. One section is specifically directed against the intentional or negligent placing of deleterious substances, such as would harm fish, into the waters covered by the article. (Blunt-Fla)

SANDERS V PLANT (SUIT TO DETERMINE WHETHER ACCRETIONS FOLLOW THE LAND CONVEYED).

204 SW 2d 323-326 (Ark 1947).

Descriptors: *Arkansas, *Accretion (Legal aspects), *Riparian land, *Boundaries (Property), Real property, Riparian rights, Maps, Judicial de sions, State governments, Land tenure, Land fo ing, Land, Legal aspects, Ownership of beds, R tive rights.

Plaintiff brought action to have defendants joined from interfering with plaintiff's possessio certain lands. The court noted that the facts ou which this litigation arose were stated in a for appeal and would not be repeated. The issue volved was whether accretions to riparian l were conveyed with the land. The co unanimously accepted the general rule that a c veyance carries all the riparian rights of the l conveyed, including accretions. The court held t a separate conveyance of riparian rights is unnec sary unless there has been a severance of the rip an rights from the land conveyed. The evide showed that there had been a separation of accretions from the land. The court held that fendants had the original t itle to the accreti since plaintiff's deed from the state for the acc tions was void because of the state's lack of po to make the sale. (Shevin-Fla)

JOHNSON CITY V MILLIGAN UTIL DIST (TILITY DISTRICTS).
276 SW 2d 748-754 (Tenn Ct App 1954).

Descriptors: *Tennessee, *Public utilities, *Wa supply, *Public utilities district, Cities, Water ra Water conveyance, Pipes, Highways, Pub benefits, Legal aspects, Judicial decisions, Lo governments, Relative rights, Contracts.
Identifiers: Adverse possession, Injunctions.

The Utility District sought to take possession o water l ine which the city had used to supply area with water and which it claimed by adve possession. The District was created by legislati act to furnish water to the area. The pipe had be built by a private landowner and used by the ci but a quit-claim deed had conveyed title to the trict. The court determined that the city's right use the pipe could not be construed as conferri upon it the right to use the line for its own purpo over the objection of the owner. Uncertainties a ambiguities in the language of the deed should resolved in favor of the innocent purchaser. T court held that a purchaser would be justified in suming that the use of the line by the ci ty was inconsistent with the record of title. The co further stated that the city's use of the pipe show an intention to treat the service not as that o public utility but as being limited by private c tract. The city did not act as a public utility a could therefore not question the sufficiency notice of the hearing before the County Court the validity of its decree. (Shevin-Fla)

Del Code Ann tit 7, secs 1901-1911 (1953), as amended (Supp 1966).

Descriptors: *Delaware, *Commercial shellfish, *Legislation, *Administrative agencies, Oysters, Clams, Permits, Legal aspects, State governments, Regulation, Leases, Beds under water, Shellfish, Boating regulations, Conservation.

The Commission is composed of five members, one of whom is elected president and one who is appointed executive secretary by the governor. Other personnel may be appointed by the Commission as necessary to carry out its duties. The Commission has full control and direction of the shellfish industry and of the protection of shellfish in the state, with general authority to promulgate and enforce appropriate regulations. The Commission: (1) operates, improves, and preserves oyster and clam beds; (2) regulates boats, equipment, or vessels used in the shellfish industry; and (3) issues permits and establishes charges and fees for taking shellfish. Provisions are made for leasing areas of specified bays to residents for planting and catching oysters and clams. Leases may be granted only to residents individually who are acting on their own behalf. In the performance of its duties the Commission is empowered to examine sworn witnesses, who may be subpoenaed to appear and subject to perjury charges for false testimony. A final section prohibits vacuum or suction mechanical devices for taking or catching shellfish. (Douberley-Fla)

409 F2d 1122-1130 (DC Cir 1969).

Descriptors: *Judicial decisions, *Administrative decisions, *Hydroelectric plants, *Hydroelectric project licensing, Administrative agencies, Federal Power Act, Colorado, Electric power production, Electric power industry, Legislation, Cost analysis, Costs, Financial analysis, Financial feasibility, Financing, Marketing, Power marketing, Planning, Management.
Identifiers: Federal Power Commission.

Petitioner filed an application for authorization to construct and operate a hydroelectric project in January of 1961. A month later the Commission informed petitioner that it was insufficiently detailed in respect to provisions for financing the project and for marketing its output. At petitioner's repeated requests for extensions, the application was held pending for six years awaiting the necessary proof of economic and financial feasibility. At the hearing to consider the application, petitioner had produced no contracts for the sale of power. Since no financing plan could be compiled without prospective buyers, the application was dismissed without prejudice. Upon review of the Commission's order, the court affirmed the dismissal. Noting that the Commission had the power to require petitioner to submit reasonably adequate information denoting financial feasibility of the project, the court held that the dismissal was not unreasonable in light of petitioner's failure to show the project's feasibility. Since the Commission's order allowed petitioner to re-apply when the necessary financial information became available, it was unnecessary to hold the application pending any longer. (Douberley-Fla)

BARTLETT V ST ALKER LAKE SPORTSMEN'S CLUB (DEDICATION OF EASEMENT TO NON-NAVIGABLE LAKE).

168 NW 2d 356-361 (Minn 1969).

Descriptors: *Minnesota, *Easements, *Non-navigable waters, Access routes, Lakes, Riparian rights, Hunting, Game birds, Waterfowl, Right-of-way, Condemnation, Legal aspects, Judicial decisions, Remedies, Public rights, Public benefits, Relative rights, Riparian rights, Riparian land.
Identifiers: Dedication, Injunction (Prohibitory).

Plaintiffs owned a shallow, marshy, non-navigable lake and the lands surrounding it. In 1967, plaintiffs brought action to enjoin trespass upon and over one of the lots bordering on the lake. In 1954, a previous owner of this lot had granted to the public the right to hunt on the lake, insofar as he possessed that right, and had conveyed a perpetual easement across a portion of his lot to allow access. The following year a local sportsmen's club had bul ldozed an access route across this easement. The trial court found that the grant of hunting and easement rights constituted an offer to dedicate and that the clearing of an access route to the lake and the use of the land by hunters was sufficient to constitute acceptance. Thus defendants had not trespassed as they had legal right to be on the land. Plaintiff appealed. The supreme court affirmed, accepting the trial court's finding that a dedication and an acceptance had occurred. It held that riparian rights to the use of the entire overlying water exist even on a non-navigable lake. It also found that while the state cannot condemn access to a private non-navigable lake, access may be accepted when offered by the riparian owner. (Gabrielson-Fla)

Identifiers: Adverse possession.

Third party defendant MacGregor sought a rehearing in the Michigan Court of Appeals on the question of whether title to certain lands created by accretion inured to him by adverse possession. The court of appeals affirmed its earlier holding that it was not adverse possession but was acquiescence. The court held that the evidence showed no definite boundary lines but only a 'live and let live' course of conduct. The court found that both parties had been using the same land over the years. Such usage of the land prevented any inuring of title by adverse possession. (Gadd-Fla)

Descriptors: *Michigan, *Public rights, *Benefits, *Dikes, Landfills, Permits, Legislation, Riparian rights, Dredging, Rivers, Navigable rivers, Navigable waters, Islands, Channel improvement, Ownership of beds, Legal aspects, Judicial decisions, Remedies, Zoning.
Identifiers: Public trusts, Nonconforming use, Injunctions (Prohibitory).

Plaintiffs brought suit to enjoin defendant's dike and fill operation off an island in the Detroit River claiming that it violated a city zoning ordinance and impaired the public trust, the wildlife habitat and the public use of the area. The trial court granted an injunction on both of these theories and defendant appealed. The court of appeals affirmed. As to the violation of the city zoning ordinance, the trial court's finding that the dike and fill operation was not carried on to a sufficient extent prior t o the ordinance adoption to be deemed a nonconforming use was upheld. In regard to the violation of the public trust, the court noted that the title of a riparian owner in the bed of a navigable river is subject to a public trust for the preservation of the various public rights. Here, there was sufficient evidence to support the trial judge's conclusion that defendant's operation created a real and substantial impairment of the public's use of t
for hunting, fishing, and boating. (Gabrielso

Descriptors: *Kentucky, *Water loss, *Water wells, *Mining, Legal aspects, Judicial decisions, Water rights, Water sources, Water levels, Coal mines, Explosives, Underground streams, Underground, Explosions, Damages, Costs, Boundaries (Property), Water supply, Water table, Relative rights, Mining engineering, Barriers, Diversion, Channels, Land tenure, Reservoirs, Deep wells.
Identifiers: *Water depletion.

Plaintiff recovered $2500 as damages for depletion of a water well on his land. The jury determined such damages to have been caused by blasting in defendant's underground coal mine. On appeal the court granted defendant's motion for a mistrial based upon improper remarks by appellee's counsel. The court went on to consider the issue of liability which it felt would arise at a new trial. The court stated that liability from blasting does not rest on negligence and the only issues to be submitted to the jury are causation and damages. The court found that defendant's evidence that the mine was dry and that there were no cracks in the roof of the mine was not conclusive to show a lack of disturbance of barriers or channels under appellee's land such as would divert a watercourse or lower the water table. The court found that the plaintiff's evidence was sufficient to create a jury question. The judgment was reversed with directions for further proceedings in conformity with this opinion. (Shevin-Fla)

JONES V WELLMAN (BOUNDARY DISPUTE).

223 So 2d 572 (4th DCA Fla 1969).

Descriptors: *Florida, *Boundaries (Property), *Boundary disputes, *Streams, High water mark, Land, Real property, Land tenure, Legal aspects, Judicial decisions.
Identifiers: *Meander line.

Plaintiff brought an action for ejectment and from a ruling for defendant, took this appeal. Plaintiff contended that the correct boundary of his property was the high water mark of Taylor Creek and that all land between the meander line and the creek was his property. Defendant contended that the correct boundary was the meander line and that plaintiff was not entitled to the land in question. The appellate court held that the evidence supported the verdict for the defendant rendered by the jury and affirmed the decision. (Shevin-Fla)

PRIVATE FISH HATCHERY.

Iowa Code Ann sec 109.54, 109.64 (1949).

Descriptors: *Iowa, *Fish hatcheries, *Regualtion, Breeding, Stocking, Fish harvest, Migration, Legislation, Natural streams, Buffalo fishes, Carp, Size, Fish stocking, Commercial fish, Commercial fishing, Permits, Legal aspects.
Identifiers: *Private waters, *Public waters, Propagation.

It shall be unlawful to operate a private fish hatchery or propagate fish native to Iowa in private waters without first obtaining a private fish hatchery license. Licenses shall not be issued to any hatchery that may be stocked with fish from public waters by overflow or natural migration. All fish acquired and distributed by private hatcheries must comply with state size and limit laws. Only native fish may be sold for stocking purposes within the state. Breeding stock must be obtained from licensed private fish hatcheries in the state or lawful sources outside the state. Fish lawfully taken by commercial fishermen may be held, fed and sold under private fish hatchery licenses. (Holt-Fla)

ANDERSEN V SCHMIDT (EASEMENT OVER LAND TO WATER'S EDGE).

168 NW 2d 437-439 (Ct App Mich 1969).

Descriptors: *Michigan, *Lake shores, *Easements, *Land tenure, Riparian land, Islands, Lakes, Shores, Boating, Land use, Legal aspects, Judicial decisions, Water law, Road construction, Boat-launching ramps, Docks, Marinas, Real property, Access routes.
Identifiers: *Boat house, Ingress, Egress.

One of defendants' predecessors in title granted to a predecessor of plaintiffs the right of ingress and egress over his land in order to get to a boathouse on the shore of Silver Lake. The agreement was recorded and appears in plaintiffs' chain of title. Plaintiffs own an island in the lake. The boathouse deteriorated and collapsed by 1960. Plaintiffs brought this action requesting the court to find an easement appurtenant over the defendants' land to the water's edge of Silver Lake. Judgment was granted for defendants and plaintiffs appealed. Plaintiffs contended the agreement created a per-

petual easement which would allow them to complete a road to the lake and construct a dock and other buildings for their use in getting to their island. The lower court held that when an easement is granted for a particular purpose it terminates when the purpose for which it was granted is abandoned. The appellate court upheld this determination and further found that the boathouse was essential to the purpose of the easement. Thus the collapse of the boathouse made the purpose of easement hopeless and impossible. The determination of the trial court was affirmed. (Shevin-Fla)

6F. Nonstructural Alternatives

SPECIAL FLOOD HAZARD INFORMATION, SHOAL CREEK, JOPLIN, MISSOURI.
Corps of Engineers, Tulsa, Okla.

Corps Eng Flood Plain Rep, Mar 1969. 5 p, 2 plate, 3 tab.

Descriptors: *Floods, *Flood damage, *Missouri, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood.
Identifiers: Joplin (Mo), Standard project flood, Intermediate regional flood.

Flooding of Shoal Creek, Joplin, Missouri is described in a report of flood plain problems based on records of rainfall, runoff, and historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occurred and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use by zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. (Knapp-USGS)
W69-09259

OPTIMIZING INVESTMENT IN FLOOD CONTROL AND FLOOD PLAIN ZONING,
Rutgers - The State Univ., New Brunswick, N.J. Water Resources Research Inst.
William Whipple, Jr.
Water Resources Research, Vol 5, No 4, p 761-766, Aug 1969. 5 p, 2 tab, 2 ref.

Descriptors: *Optimization, *Flood plain zoning, Benefit-cost ratio, Economics, Flood control, Non-structural alternatives.
Identifiers: Project-induced economic growth.

Recent governmental actions have accentuated flood plain zoning as an alternative to structural flood control. Optimization of investment between these alternatives requires consideration of project-induced development (economic development which would not occur if the project were not built) and site income (the return to the owner of new construction in the flood plain net of the cost of their development). These concepts are used to develop quantitative criteria applicable to determining to what extent zoning is practicable and to determining a correct benefit-cost ratio for the optimum solution. Results indicate that previously existing methods that do not take account of damages to project-induced growth may give unduly high benefit-cost ratios. It should normally be expected that a combination of flood control and zoning will be most productive. (Marriott-Chicago)

6G. Ecologic Impact of Water Development

PHYSICAL IMPLICATIONS OF LARGE-SCALE WATER TRANSFERS,
California Univ., Richmond. Sanitary Engineering Research Lab.
Percy Harold McGauhey.
IN W.G. McGinnies and B.J. Goldman, Eds., Arid Lands in Perspective, p 358-363, University of Arizona Press, Tucson, 1969. 6 p, 1 tab, 5 ref.

Descriptors: *Water transfer, *Evaluation, *Interbasin transfer, Arid lands, Arid climates, California, Export, Import, Municipal water, Water conveyance, Water distribution (Applied), Dissolved solids, Irrigation water, Impared water quality, Water pollution, Administration, Southwest U.S., Arizona, Irrigation programs, Planning, Riparian rights, Human population, Social impact.
Identifiers: North American Water and Power Alliance.

It is characteristic of most every effort man has made to shape his environment that he has viewed his objective more as an isolated task rather than as one facet of a complex system existing in a dynamic equilibrium, often with negative results. This paper explores one facet of such a task: physical implications of large-scale water transfers. The development of natural transfer systems, rivers, is traced, including riparian ownership, quality, quantity, and return-waters. Man-made transport systems are termed 'rivers in reverse'; problems of dissolved solids build-up, seepage, and riparian ownership are discussed. The physical results of long-term large-scale use of imported water in arid lands are considered. Several past projects are reviewed. The physical and social effects of not employing large-scale water transfers are explored. Objections to such schemes as the North American Water and Power Alliance are listed. The nature of the transfer systems involved may cause government, for good or evil, to guide land use planning and economic growth, control patterns of urbanization and meet some of man's recreational needs. (See W69-09210). (Sherbrooke-Ariz)

SOCIAL AND ECOLOGICAL IMPLICATIONS OF WATER IMPORTATION INTO ARID LANDS,
Texas Technological Coll., Lubbock.
Gerald W. Thomas, and Thadis W. Box.
IN W.G. McGinnies and B.J. Goldman, eds., Arid Lands in Perspective, p 363-374, University of Arizona Press, Tucson, 1969. 12 p, 7 fig, 38 ref.

Descriptors: *Water transfer, *Social impact, *Ecology, *Arid lands, Mosquitoes, Distribution patterns, Diversion losses, Fish management, Interbasin transfers, Land clearing, Water demand, Wildlife management, Long-term planning, Coordination, Decision making, Water resources development, Social aspects, Estuarine environment, Microenvironment, Terrestrial habitats, Wildlife habitats, Irrigation effects, Aquatic habitats, Balance of nature.
Identifiers: California State Water Project, Texas Water Plan, North American Water and Power Alliance, Australian Snowy Mountain, G reat Lakes Plan for the Amazon, Aswan High Dam.

Large-scale water movement to the arid zones appears to be inevitable. Pressures for these projects increase because they are technologically possible, economically possible, and may be necessary for society to survive and grow. Several examples of large scale water projects are presented; California State Water Project, Texas Water Plan, North American Water and Power Alliance, Australian Snowy Mountain, Great Lakes Plan for the Amazon, Aswan High Dam. The social and ecological implications of some of these projects are considered. Changes in fish species and populations, bird migratory routes and densities and terrestrial habitat destruction are documented. Wider mass use of insecticides, increases in mosquito populations, and alteration of microhabitats are to be expected. The authors urge that sound ecological studies be incorporated in the initial planning for large scale water movement. It is highly possible that ecological understanding could be the major factor in decision-making -- even overriding political, social or economic considerations. No example of good advanced planning involving the entire scientific community could be found. (See W69-09 (Sherbrooke-Ariz)

APPLICATION OF DEEP ELECTRI SOUNDINGS FOR GROUNDWATER PLORATION IN HAWAII,
Geological Survey, Denver, Colo.
Adel A. R. Zohdy, and Dallas B. Jackson.
Geophysics, Vol 34, No 4, p 584-600, Aug 17 p, 19 fig, 1 tab, 20 ref.

Descriptors: *Electrical studies, *Geoph *Groundwater, *Hawaii, Surveys, Resistivity, trical resistance, Rock properties, Water Aquifers, Basalts, Saline waters-freshwater faces, Exploration.
Identifiers: Groundwater prospecting, Elec sounding.

Resistivity soundings, using Schlumberger equatorial dipole electrode configurations, made on the islands of Oahu and Hawaii to mine the applicability of direct current resis methods for locating freshwater aquifers i State of Hawaii. The soundings were made

thwestern part of the island of Oahu near the
n of Waialua and on the island of Hawaii of the
ddle' area near Pohakuloa and Humuula. In-
pretation of 32 sounding curves obtained on the
nd of Oahu indicates that it is possible to corre-
5 stratigraphic units underlain by a vesicular
alt basement and that the determination of the
proximate depth to the freshwater-saline-water
rface within the basalt is feasible. Near the
n of Waialua the aquifer is a coral zone as well
parts of the weathered vesicular basalt base-
nt. On the island of Hawaii, near Pohakuloa, an
loratory well drilled in basalt to a depth of 1001
rior to the resistivity survey proved to be dry. In-
pretation of 13 deep soundings made with
lumberger and equatorial arrays suggests that
minimum depth to a conductive layer, which
represent basalt saturated with freshwater, is
ut 2700 ft below land surface. The groundwater
ears to be dike-impounded. (Knapp-USGS)

SH-WATER SPRINGS OF HAWAII FROM
RARED IMAGES,
logical Survey, Washington, D.C.
liam A. Fischer, Dan A. Davis, and Theresa A.
.
l Surv Hydrol Invest Atlas HA-218, 1 sheet,
6. Text, 28 fig, 1 plate, 1 tab, 2 ref.

Descriptors: *Remote sensing, *Springs, *Discharge (Water), *Hawaii, Infrared radiation, Mapping, Aerial photography, Cold springs, Fresh water, Surveys.
Identifiers: Hawaii County (Hawaii), Radiometry.

To study spring discharges into the ocean from the island of Hawaii, infrared images showing water temperatures in the ocean near the island were obtained in 1968. Positive prints from negatives made with electro-optical scanning radiometers show differences in apparent temperatures in shades of gray. Spring water shows on the prints because it is cooler than ocean water. Most discharge of water from Hawaii is in sea-level springs. Streamflow is intermittent because of extremely rapid infiltration into highly permeable volcanic rocks. Spring locations, areas of thermal anomalies, and descriptions are tabulated. Aerial photographs and radiographic prints are marked to show thermal anomalies and spring locations. (Knapp-USGS)

AIRBORNE REMOTE SENSING FOR GROUNDWATER STUDIES IN PRAIRIE ENVIRONMENT,
Department of Agriculture, Edmonton (Alberta). Water Resources Div.
M. E. Chase.
Can J Earth Sci, Vol 6, No 4, Part 1, p 737-741, Aug 1969. 5 p, 4 fig, 9 ref.

Descriptors: *Remote sensing, *Aerial photography, *Infrared radiation, *Groundwater movement, G lacial drift, Soil moisture, Vegetation effects, Water temperature.
Identifiers: *Canada, Alberta.

A deficiency of groundwater in an area of prairieland in southern Alberta prompted a survey by airborne remote sensors. Panchromatic and black and white true infrared photography coverages were obtained and studied, but were found to be of limited value. An infrared scanning survey, using the 2.5-5.6 micron band was flown at the same time and found to be more informative. Conditions of ground truth were not ideal, making the results less conclusive than desired. Till covers most of the area, with lake deposits on the eastern section. Soil moisture changes were registered on the imagery, but the depths of overburden to which these changes were recorded on the surface are unknown, due to the condition variations between the time of the survey and the drilling. Vegetation, surface water, soil moisture, and saline sloughs were found to have the strongest thermal signatures. Problems encountered in the survey are discussed and recommendations to eliminate them are given. (Knapp-USGS)
W69-09239

SOME GUIDELINES FOR REMOTE SENSING IN HYDROLOGY,
Geological Survey, Washington, D.C.
Charles J. Robinove, and Daniel G. Anderson.
Water Resources Bull, Vol 5, No 2, p 10-19, June 1969. 10 p, 4 fig, 9 ref.

Descriptors: *Remote sensing, *Surveys, *Hydrologic data, *Reviews, Aerial photography, Infrared radiation, Instrumentation, Mapping, Photogrammetry, Photometry, Terrain analysis, Telemetry, Satellites (Artificial).
Identifiers: Infrared imagery, Satellite photography.

Remote sensing in the field of hydrology is beginning to be appied to significant problems, such as thermal pollution, in many programs of the Federal and State Governments as well as in operation of many private organizations. A discussion of the subject is given to guide the hydrologist to a better understanding of how he may collect, synthesize, and interpret remote sensing data. The techniques discussed include color aerial photography, infrared aerial photography, infrared imagery and photogrammetry. Data reduction methods and equipment are briefly outlined. Like any other new technique remote sensing will eventually find its place in the resource disciplines. It wil l also have its pitfalls, many of which probably can be avoided by proper planning of projects and through knowledge of the capabilities of remote sensing systems. It is the task of the hydrologist, at this time, to assess his needs for data, to match them with the capabilities of remote sensing systems and the presently used data collection systems, and use them in the most beneficial way. (Knapp-USGS)
W69-09241

METEOROLOGICAL EXPERIMENTS FOR AUTOMATED SATELLITES,
National Aernautics and Space Administration, Washington, D.C. Dept. of Meteorology and Soundings.
William C. Spreen.
Water Resources Bull, Vol 5, No 2, p 20-35, June 1969. 16 p, 5 fig, 1 tab, 15 ref.

Descriptors: *Satellites (Artificial), *Meteorology, *Remote sensing, Surveys, Synoptic analysis, Weather forecasting, Aerial photography, Solar radiation, Winds, Clouds, Cloud cover, Energy budget.
Identifiers: Meteorology satellites.

The satellites used in meteorology include TIROS, ESSA Nimbus, and Applications Technology Satellite (ATS). The first three operate in the orbital altitudes of about 1000 to 1200 km while the fourth, ATS, is at geosynchronous altitude of 36,000 km. Cloud cover is observed operationally from low orbit and experimentally from synchronous altitude. Wind velocity has been inferred from the frequent cloud cover pictures taken by ATS, and satellite-balloon systems are being developed which will locate and track constant-density level balloons for determining wind flow. Spectrometers and radiometers operating in the electromagnetic spectral region from the ultraviolet to the microwave region are being developed to quantitatively measure temperature, water vapor, density and wind profiles. These will furnish data for the development and testing of atmospheric models for numerical prediction. In addition, experiments are being developed to measure ozone, other constituents of the air, solar energy, surface conditions, heat balance, and other atmospheric attributes which effect the structure and dynamics of the atmosphere. (Knapp-USGS)

TIME LAPSE AERIAL PHOTO ANALYSIS OF THE CONNECTICUT RIVER FROM 1952 TO 1965,
Massachusetts Univ., Amherst. Dept. of Forestry and Wildlife Management.
William P. MacConnell, and G. Peter Stoll.
Water Resources Bull, Vol 5, No 2, p 37-50, June 1969. 14 p, 9 ref.

Descriptors: *Aerial photography, *Photogrammetry, *Land classification, *Recreation, *Rivers, Land management, Surveys, Land appraisal, Land development, Land resources, Water quality, Streamflow, Floods, New England.
Identifiers: *Connecticut River.

Aerial photogrammetric techniques were developed and tested for identifying and classifying river-based recreation sites. A classification system was designed to describe the nature of the land itself, the land use, or the vegetation on the landscape. The Connecticut, a large river running through four states, was examined and classified using the system. Analysis of two sets of aerial photographs taken with a time lapse of 10 to 13 years enabled determination of past use and development trends. A catalogue of maps classifying strips of land adjacent to the river was prepared and reproduced for use by interested planning agencies. Statistics on land area by types for the river as it now is and as it was 10 to 13 years previously have been prepared by towns, counties, and

states. The aerial photographs proved invaluable for analyzing the recreational potential of the Connecticut River. (Knapp-USGS)

RADIOACTIVE METHODS FOR THE QUANTITATIVE DETERMINATION OF COASTAL DRIFT RATE,
Centre d'Etudes Nucleaires de Saclay, Gif-sur-Yvette (France).
G. Courtois, and A. Monaco.
Marine Geol, Vol 7, No 3, p 183-206, June 1969. 24 p, 14 fig, 2 tab, 25 ref.

Descriptors: *Sediment transport, *Littoral drift, *Tracers, *Tracking techniques, Radioisotopes, Marking techniques, Sediments, Sands, Radioactivity techniques.
Identifiers: Sediment tracking.

A new method, known as the count rate balance is presented for the quantitative evaluation of coastal drift. It is based on conventional radioactive tracer experiments to which are applied space integration measurements. The count rate balance operation consists of the determination, from the family of isocount curves, of the total number of counts detectable over the radioactive patch as a whole. Once the thickness of the layer in movement is known, the solid displacement rate can be calculated. This method was applied to a radioactive tracer experiment carried out on Apr. 20, 1967 on the Roussillon coast (southwestern France) by immersion of 4.2 kg of natural sediment labelled with 10 Ci of chromium 51 (half-life 27.8 days), at a depth of 4 m between 2 folds in the sea bed. The transport was governed by 2 dominant types of wind and swell conditions. From Apr. 20-29, swells from the north led to a southward displacement of about 1.05 tons/day/linear meter. The method has the advantage of requiring no special equipment apart from that needed in conventional radioactive tracer experiments, and no sampling is necessary. (Knapp-USGS)

RUNS OF PRECIPITATION SERIES,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering; and Colorado State Univ., Fort Collins. Dept. of Mathematics and Statistics.
Jose Llamas, and M. M. Siddiqui.
Colo State Univ Hydrol Pap No 33, May 1969. 25 p, 7 fig, 7 tab, 6 ref, 2 append.

Descriptors: *Statistical methods, *Hydrologic data, Data processing, *Analytical techniques, Time series analysis, Statistics, Correlation analysis, Markov processes, Stochastic processes, Probability, Synthetic hydrology, Precipitation (Atmospheric).
Identifiers: Hydrological series analysis.

Three quantitative measures are introduced for the concepts of 'surplus' and 'deficit' in hydrologic series. These are: run-length, run-sum and run-intensity. Positive and negative runs of a series are defined in terms of a fixed value of the variable under consideration, in this case precipitation. The distribution function, moments, and other statistical properties of run-length, run-sum, and run-intensity, are obtained analytically, using two assumptions on the sequence of annual precipitations that it is independent and normally distributed and that it is independent and gamma distributed. For monthly precipitations the series was first standardized as a 2-state Markov chain with stationary transition probabilities. Annual precipitation from 27 stations in Colorado, and monthly precipitation from 219 stations in the Western United States are analyzed. (Knapp-USGS)

EVALUATION OF THE CARBON-14 TECHNIQUE FOR MEASUREMENT OF PRIMARY PRODUCTION,
Kaiser Foundation Research Inst., Richmond, Calif. Lab. of Comparative Biology.
M. B. Allen.
Proc 1st Nat Symp on Radioecology, Colorado State Univ, Ft Collins, Sept 10-15, 1961. Radioecology, 1963, Reinhold Pub Corp, NY and Amer Institute of Biological Sciences, Wash, DC, Schultz, Vincent and Klement Jr, Alfred W (Eds), p 477-480. 60 ref.

Descriptors: *Productivity, *Carbon radioisotopes, *Tracers, *Photosynthesis, *Phytoplankton, *Inorganic compounds, *Organic compounds, Light intensity, Light quality, Pigments, Nutrient requirements, Ecology, Sampling, Radioactivity, Carbon dioxide, Algae, Respiration, Chlorophyll.
Identifiers: Chromulina pusilla.

The carbon-14 (C-14) technique of measuring the production of organic material by natural populations is the best method currently available. Its application has stimulated considerable work on the relations between light, photosynthesis, pigmentation, and nutrition--all adding to understanding of phytoplankton ecology. This technique assesses amount of inorganic carbon converted into organic form by the photosynthesis of phytoplankton, almost completely supplanting other assay methods because of its great sensitivity. In this procedure, a prescribed amount of C-14 is introduced into a bottle filled with a water sample, the bottle is incubated, either in situ or in an illuminated incubator, for several hours; the cells are filtered off using a Millipore filter, treated to remove adsorbed or precipitated inorganic carbon, dried, and the C-14 concentration is measured. The problems are discussed in detail together with experiences of earlier investigators. They include, among others, size of samples, conditions for incubation, light screens, temperature, depth, time of day, proper pore size of filters, removal of adsorbed or precipitated inorganic carbon. It seems unlikely that a single correction for respiration covering all phytoplankters in all physiological conditions is possible. (See also Vol 2, No 19, Field 5C, W69-07863). (Jones-Wis)

METHODOLOGY OF HYDROLOGIC MODEL BUILDING,
Geological Survey, Menlo Park, Calif.
David R. Dawdy, and R. W. Lichty.
Symp on Use of Analog and Digital Computers Hydrol, Tucson, Ariz, Dec 1968, Vol 2, Int Ass Sci Hydrol, Publ No 81, p 347-355, 1968. 9 p, 2 fig, 2 tab, 12 ref.

Descriptors: *Model studies, *Rainfall-runoff relationships, *Computer models, *Mathematical models, Digital computers, Computer programs, Streamflow forecasting, Parametric hydrology, Infiltration, Surface-groundwater relationships, Simulation analysis, Optimization.
Identifiers: *Rainfall-runoff models.

Two alternative representations of the infiltration component of a rainfall-runoff simulation model are investigated. Four criteria for choice between the 2 which are considered are accuracy of prediction, simplicity of the model, consistency of parameter estimates, and sensitivity of results to changes in parameter values. Sensitivity plots are presented for obtaining an understanding of interactions in the model by studying several errors functions simultaneously. The tools presented are shown to aid in the subjective decisions which must be made in the construction and use of a rainfall-runoff model. (Knapp-USGS)

SIMULATION OF THE HYDROLOGIC-ECONOMIC FLOW SYSTEM,
Utah Water Research Lab., Logan. Dept. of Civil Engineering.
Murland R. Packer, J. Paul Riley, and Eugene K. Israelsen.
Symp on Use of Analog and Digital Computers Hydrol, Tucson, Ariz, Dec 1968, Vol 2, Int Ass Sci Hydrol, Publ No 81, p 386-391, 1968. 6 p, 4 fig, ref.

Descriptors: *Mathematical models, *Computer models, *Water utilization, Irrigation water, Economics, Model studies, Planning, Optimization, Simulation analysis, Systems analysis, Analog computers, Evapotranspiration, Hydrologic budget, Crop production, Water management (Applied).

dentifiers: Economics of water use.

ncreased demands upon available land and water esources have resulted in detailed optimum-use onsiderations in terms of economic efficiency in vater resources planning and management. Effec- ive management of these resources requires an ex- amination of the hydrologic flow system and of the elated economic production functions. The elec- ronic analog computer is a valuable computational levice which can simulate the hydrologic and economic processes of a total system in water esource planning and development. The various economic hydrologic functions were interrelated by the mass continuity concept, by which it was possible to predict the flow of money and water within the system in terms of their occurrence in space and time. Water values are investigated by directing water to various alternative uses from a particular phase of agriculture. The resulting change in net benefits both to the system as a whole and to individual sectors of the economy are then observed. (Knapp-USGS)

ADAPTION OF ELECTRONIC COMPUTER FOR IMPROVED METHOD OF MODELING SURFACE RUNOFF FROM RAINFALL FOR SMALL WATERSHEDS,
Utah Water Research Lab., Logan. Dept. of Civil Engineering.
Roger A. Amisial, and J. Paul Riley.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Vol 2, Int Ass Sci Hydrol, Publ No 81, p 392-404, 1968. 13 p, 7 fig, 4 ref.

Descriptors: *Model studies, *Rainfall-runoff relationships, *Small watersheds, *Analog models, *Arizona, Routing, Streamflow forecasting, Mathematical models, Streamflow, Hydrographs, Synthetic hydrology, Analog computers, Overland flow.
Identifiers: Walnut Gulch (Ariz).

In the field of surface water hydrology, the fundamental equations of motion and continuity adequately portray the overland and channel flow phenomena. The differentail equations, however, are not easily amenable to solution, and their integration in closed form can be obtained only for extremely simplified cases. Techniques of integration by numerical methods have been developed, which can be handled by use of electronic computers. Combined with basic mathematical operations, the electronic analog computer can be successfully employed in the solution of surface runoff models described in terms of the 2 fundamental equations. The watershed is divided into subzones based on topography or physiography. The subzone is simulated by an equivalent rectangular basin transected by the main stream channel. Using the 2 fundamental equations of flow, the water is routed over the basin slopes with the rainfall as input and through the channel system which receives lateral flow from the basin slopes. Models based on the derived equations and on simplified forms of these equations are being developed in an attempt to assess the validity of these equations for some simplifying assumptions made in the usual routing procedures. Tests of the mathematical models are being made by simulating subbasins of the Walnut Gulch Experimental Watershed near Tombstone, Arizona. (Knapp-USGS)

COMPUTER SIMULATION OF REMOTE SENSING BY MICROWAVE RADIOMETERS,
Ryan Aeronautical Co., San Diego, Calif.
E. Dedman, J. Culver, and F. Janza.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Vol 2, Int Ass Sci Hydrol, Publ No 81, p 485-497, 1968. 13 p, 4 fig.

Descriptors: *Remote sensing, *Model studies, *Simulation analysis, Mathematical models, Analog models, Digital computers, Systems analysis, Operations research.
Identifiers: *Microwave radiometers, Radiometry.

A computer simulation of airborne microwave radiometers as remote sensors for mapping thermal upwellings in the ocean is described. The importance of correlating 'ground truth' data to radiometer brightness temperature for deriving and validating mathematical models is pointed out. Methods of studying system characteristics using simulations are proposed and the value of such studies in reducing the cost of expensive field testing is emphasized. The benefits in utilizing analogous experience gained in the development of large space systems in evaluating remote sensing for hydrology are enumerated and specific analogies discussed. Identifiers: United Nations.

A summary is presented of the use of digital computers for water resource projects in several countries. These projects are conducted by the Food and Agriculture Organization of the United Nations, funded by the United Nations Development Program. The difficulties which must be overcome include allocation of budget, location of computer near project area, training of United Nations personnel, and training of government counterpart personnel. Training is currently being carried out in field projects through use of short term consultants. Use of computers in water resource studies in less developed countries can provide better answers in order to minimize the risks of poorly considered capital investments. (Knapp-USGS)

Water resources management requires a large amount of calculation of probability distribution functions of daily discharges. The normal, the logarithmic-normal and the gamma distributions were studied. Parameters of the distribution functions were estimated by the maximum likelihood method. Some details of the solution achieved by electronic computer include the ranging of sample elements according to order of magnitude, the computation of some parameters through solving an implicit system of equations by iteration, and some problems of the performance of the chi-squared test. Probability distribution functions of stream discharges were studied in the interest of water resources management in Hungary. (Knapp-USGS)

Identifiers: *India.

An analytical approach based on the theory of dams by Moran is presented for developing a set of general curves relating storage capacity to the annual draft. The variables involved are expressed in standardized form so that the curves can be of general applicability. The annual inflow variable (or its known transform) is assumed to be normally distributed. Assuming the standardized inflow variable to take discrete values over the whole range, the probabilities of reservoir content before utilization are calculated for relevant combination pairs of capacity and annual draft. The process involved framing of sets of simulaneous equations of varying number of unknowns for different pairs of capacity and draft, and working out their solutions. The procedure, which is quite involved, could be easily run through an Electronic Computer. An idea of the general computer program in Fortran II prepared for the IBM 1620 Electronic Computer is also given. (Knapp-U SGS)

Identifiers: US Geological Survey.

Well-inventory, water-quality, lithologic-log, and water-level data are basic to groundwater studies. Computer programs designed to facilitate the collection and processing of these data are coordinated with and are complementary to the design and implementation of coding forms, manuals, and systems. Digital computer programs developed in the Kansas District of the Water Resources Division, U.S. Geological Survey that materially aid hydrologists in field work include: checking, tabulation, standard analysis, and mapping or graphic-plot routines. Quality control of data is obtained by proofing computer output from checking and tabulation programs against source documents, so that errors infrequently occur in the results of subsequent programs. A hydrologist, with the assistance of frequently-updated computer output, can schedule field work more efficiently. The work plan can be selectively modified throughout the period that the hydrologist is engaged in relatively short test-drilling, well-inventory, or water-sampling phases of a project. The flexibility in scheduling and modifying field work obtained through usage of computer programs facilitates collection of groundwater data. This flexibility provides for better utilization of time, money, personnel, and equipment. (Knapp-USGS)

Identifiers: Linked reservoir systems.

Month-by-month control rules were formulated by digital computer for a pair of reservoirs meeting a common demand and for a single reservoir worked jointly with a seawater desalination plant. A dynamic programming approach was based on inflow probabilities, and allowed for 64 possible combinations of reservoir contents and preceding inflows. A search of 34 years of inflows was used to find a 'worst case' basis for deciding at what reservoir contents the desalination plant should start to operate. By adopting the control rule it was shown that the linked system reduced operating costs by 30 to 50% below those of a year-round supply by desalination. (Knapp-USGS)

THE PROBLEMS OF ESTIMATING WIND LOADING ON STRUCTURES WITH SPECIAL REFERENCE TO COOLING TOWERS,
National Physical Lab., Teddington (England). Aerodynamics Div.
C. Scruton.
IN Natural Draught Cooli ng Towers - Ferrybridge and After, The Institution of Civil Engineers, p 85-89, 1967. 5 p, 5 fig, 1 tab, 10 ref.

Descriptors: *Cooling towers, *Structural design, *Model studies, Flow separation, Design criteria, Reynolds number, Wind velocity, Simulation analysis.
Identifiers: Pressure coefficient, Shape coefficient, *Wind-loading, *Ferrybridge, Code of practice, Wind tunnel.

The problem of estimating design wind forces and pressures on buildings and structures is divided into assessments of (a) the design wind speed, and (b) the shape and pressure coefficients. A considerable degree of uncertainty exists in the estimates of both the design wind speeds and the coefficients. A method for obtaining design wind speeds is described which is based on Shellard's maps showing the distribution of the maximum mean hourly wind speed at height 33 ft over the United Kingdom, and a simple procedure is given for converting these speeds to refer to gust speeds for shorter durations and to other heights. Maximum gust speeds averages over 10s and the extreme gust (less than 3s (seconds)) are recommended respectively for the consideration of stability and for the local pressures on cladding. For many structures the design demands more detailed and specific wind-loading data than are given in Codes. Consideration is given to the conditions under which wind-tunnel tests are conducted. Practical modeling difficulties lead to some uncertainty in extrapolating test results to full-scale towers. (Sherman-Vanderbilt)

H. C. Shell ard.
Natural Draught Cooling Towers-Ferrybridge and After, Proceedings of the conference held at the Institution of Civil Engineers (June 12, 1967), p 67-72, 1967. 1 fig, 1 tab, 16 ref.

Descriptors: *Wind pressure, Wind velocity, Flow profile, Frequency analysis, Structural design.
Identifiers: *Wind records, Topographic effects on winds, United Kingdom, Anemograph.

The nature of the continuous wind records that are maintained in the U.K. and the distribution of the stations providing such records to the Meteorological Office are described. The method of routine analysis of the records is indicated. For structural design purposes only the strongest winds are relevant and the statistical method used to analyze the annual extremes in order to obtain estimates of the probable maximum speeds likely to be exceeded only once in 50 or 100 years is outlined. Other important aspects affecting the choice of design speed for a structure are the variation of speed with height above the ground, the relationship between maximum speed and averaging time and the effects of ground roughness and topography. Current practices for dealing with these are described, indicating their background and what is being done to overcome certain limitations. (Ross-Vanderbilt)

COOLING TOWERS: STEP-CHILDREN OF INDUSTRY,
Lilie-Hoffmann Cooling Towers, Inc., St. Louis, Mo.
James Willa.
Heating, Piping and Air Conditioning, Vol 38, No 1, p 153-158, Jan 1966. 9 fig.

Descriptors: *Thermal pollution, *Cooling towers, *Maintenance, *Application methods, *Fungicides, *Thermal capacity, Chemical wastes, Distribution, Heat transfer.
Identifiers: *Polychlorophenate, *Delignification, *Soft rot, *White pocket rot, Plenum.

Regular and thorough maintenance of cooling towers is discussed, and an effective, safe, and economical method of spraying fungicides into plenum areas is recommended. The maintenance problems are recognized as pollution (chemicals in treatment), labor, safety, and economics. In a plant, the types of wood attack known are: delignification, (chemical), biological surface attack and internal fungus attack. The thermal capability of a tower can be seriously affected by minor neglect because it depends on the tower's distribution characteristics, or a constant ratio of water to air throughout the tower. The treatment involves assuring a pH of between 6.0 and 7.0 and applying a monoxidizing algaecide-fungicide and a chromate residual. A method of applying polychlorophenates directly in plenum areas has been developed. Economic considerations and equipment needs for these methods are presented. (Sherman-Vanderbilt)

WHAT LESSONS FROM FERRYBRIDGE.

Engineering, Vol 202, p 339-402, Sept 2, 1966. 6 fig.

Descriptors: *Cooling towers, *Failures, *Design criteria, *Structural engineering, *Structural stability, *Tensile stress, *Vibrations, *Reynolds number, Wind velocity, Pressure head, Model studies.
Identifiers: *Ferrybridge power plant, *Wind loading, Wind fluctuation, Wind tunnel experiments.

This article reports the technical factors of failure at the Ferrybridge power plant. Evidence from the collapse, eyewitness accounts and a later steeplejack inspection are considered. Although wind speeds did not reach the theoretical limit, the plant construction required an extrapolation of the structural dimensions, affecting its wind resistance capabilities. Furthermore, the validity of the wind loading data is questioned. The following recommendations are made for a more thorough study of the philosophy of cooling tower design including: (1) Design wind speeds and their conversion into wind pressures, (2) Factors accounting for grouping effects and fluctuating loads, (3) Factors accounting for structural considerations other than those mentioned, (4) Material strength characteristics for concrete and steel reinforcement. Specific studies of wind stress on cooling towers should be pursued intensively. There is a need for more data on gust characteristics. Wind loading should be specified more carefully or in simple functional terms, never as a dual specification. Meteorological data on t he probable maximum ten second average wind speed for a fifty year period is recommended to the designer. Research and development data should be immediately accessible to consultants and contractors. (Sherman-Vanderbilt)

William N. Gill, Ulku Guceri, and Richard J. Nunge.
Office of Saline Water Res and Develop Progr Rep No 443, June 1969. 37 p, 10 fig, 1 tab, 24 ref. OSW Grant No 14-01-0001-1096.

Descriptors: *Open channel flow, *Dispersion, Laminar flow, Convection, Hydraulics, Diffusion, Mixing, Model studies, Mathematical models.
Identifiers: Diverging channel flow, Peclet number, Annular channel flow.

Dispersion in flow in diverging channels, where the velocity decreases with axial distance is studied. Numerical experiments indicate that at sufficiently large values of the angle of divergence and Peclet number, both axial and transverse molecular diffusion play a minor role in the dispersion process and the system is dominated by convection. This is in marked contrast to parallel wall systems. A dispersion model was developed for such flows for limited ranges of the Peclet number and angle of divergence. At sufficiently large values of dimensionless time the dependence of concentration on both axial position and time can be represented by a single similarity coordinate. This behavior is predicted by both numerical solutions of flow equations and analytical solutions of the dispersion model. Dispersion in concentric annuli was considered also and an explicit expression for the dispersion coefficient was derived from first principles. (Knapp-USGS)

8C. Hydraulic Machinery

HYDRAULICS OF CIRCULATING SYSTEMS,
Tennessee Valley Authority, Knoxville.
Clifton W. Bolieau.
Journal of the Power Division, Proceedings of the ASCE, Vol 85, No PO1, p 1-22, February 1959. 4 fig, 2 tab, 5 ref.

Descriptors: *Tennessee Valley Authority Project, *Hydraulic engineering, *Hydraulic design, *Condensers, *Cooling water, Pump testing, Repairing, Pumping plants, Water level fluctuations, Valves, Slime, Conduits.
Identifiers: *Circulating water system, Vacuum system.

This paper discusses the factors entering into the design of condenser circulating water systems, with particular reference to those in the TVA project. These factors include determination of design flow, pump selection and setting, waterway design, air accumulation and removal, pump testing, and system operation. The TVA systems vary according to size, steam conditions, terrain, construction cost, value of power, quality and quantity of cooling water, water level fluctuations and others, so individual computations and structural decisions are made. The data is reported for each plant although the figures show typical structures. The design is discussed in terms of the most efficient operational principles and of materials and cost. Specific details are given for numerous design decisions encountered in the TVA system. (Sherman-Vanderbilt)

Engineering Research Bulleti n B-98, April 1969. 85 p, 10 tab, 66 fig, 4 append. Available for $3.00 a copy from Engineering Publications, Hammond Bldg, Penn State Univ, University Park. 16802.

Descriptors: *Open channels, *Supercritical flow, *Transition flow, *Froude number, Channel flow, Water flow, Upstream, Downstream, Walls, Engineering structures, Uniform flow.
Identifiers: *Centerline, *Rectangular channel, *Trapezoidal channel, Wave patterns.

Transitions of three different shapes were tested for Froude numbers varying from 1.2 to 3.2, representing test flows of 0.57 to 4.47 cubic feet per second (cfs). Each transition connected an upstream rectangular channel with a downstream trapezoidal channel, all three parts lying on one straight centerline. One transition had warped walls. The other two effected the transitions with plane walls: one with a vertical surface above a sloping surface, the other with a sloping surface above a vertical one. The experiments with each of the three shapes covered combinations of five transition lengths with three depths in the rectangular approach channels. Thirty-one different transitions were investigated for the case of constant and continuous invert slopes equal to the rectangular channel slope for uniform flow. Graphs summarize the variation of the water surface along the channel walls and centerline, caused by the wave patterns of supercritical flow. These graphs indicate the complex wave patterns, and they are also a basis for designing transitions of the three shapes tested. A guide is offered for application of the extensive data to actual design. (Sink-Penn State Univ)

METHOD AND MANNER OF TAKING FISH.

NH Rev Stat Ann secs 211:1-211:17-C (1964), as amended, (Supp 1967).

Descriptors: *New Hampshire, *Fishing, *gear, *Fish, Fish conservation, Fish harve establishment, Fish populations, Fish manag Fish types, Sport fish, Sport fishing, Water Recreation, Ice, Regulation, Legislation, aspects, Hunting, Bodies of water, Ice fishi lakes, Permits, Lakes, R ivers, Streams, Tr mon, Carp, Fly fishing, Bait fishing, Baits, Seasonal, Expl osives, Poisons, Obstruction Weirs, Outlets, Inlets (Waterways), Nets, Gates, Water levels, Fry, Fertilizers, Sm terstate rivers.
Identifiers: Penalties (Civil), Bobhouse, pouts.

The method and manner of taking fish in th waters of New Hampshire is specifically re Use of nets and bow and arrow to take fish o restricted to certain species. Use of explosi structions to fish passage, water taps, jacklights, and other such devices and met take fish is prohibited. Only bait and fly fi permitted in certain waters. Ice fishing and bob houses is restricted to certain waters a ject to specific regulations. Only certain t fish may be legally used as live bait. L fishermen of each respective state sha reciprocal fishing rights upon interstate ponds and rivers. (C arruthers-Fla)

ptors: *Publications, *Water resources, eys, *Reviews, *Bibliographies, Libraries, nentation, Information retrieval, Data e and retriev al, Data transmission, Libraries, cts, Classification.
iers: Survey of Water Resources Publica-

l of 1964 serial titles with probable relevance field of water resources were identified. nen issues of approximately 900 serials were d in Washington, D. C. area libraries. Of 867 serials were found to satisfy the subject and serial criteria developed for this study and were analyzed in depth. Selected information on each serial was recorded individually on a data sheet developed specifically for this project in conjunction with the staff of the Water Resources Scientific Information Center. In addition, a data file system providing for storage, maintenance, and retrieval of data on each serial was designed and put into service. Some of the current characteristics of water resources serials are discussed with particular emphasis on primary scientific or technical serials. Recommendations, based upon the findings of the study, are made for the inclusion of additional serials in the data file system. (Knapp-USGS)
W69-09258

COMPUTER DOCUMENTATION AND RETRIEVAL OF HYDROLOGIC INFORMATION FOR SMALL RESEARCH GROUPS OR INDIVIDUALS,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
Henry W. Anderson, and Theodor B. Yerke.
Symp on Use of Analog and Digital Computers in Hydrol, Tucson, Ariz, Dec 1968, Vol 2, Int Ass Sci Hydrol, Publ No 81, p 555-560, 1968. 6 p, 1 tab, 31 ref.

Descriptors: *Information retrieval, *Documentation, *Data storage and retrieval, *Data processing, *Computer programs, Digital computers, Bibliographies, Classification, Editing, Publications, Reviews, Abstracts, Data collections.
Identifiers: Small-operation data systems.

The development of computer-based information handling systems designed to give direct support to the documentation and retrieval needs of individual researchers has received scant at tention. The difference between personal-use systems and large, library-oriented systems is not well understood. The U.S. Forest Service has developed a personal documentation system (FAMULUS) which 'automates' a personal file and provides updating, editing, vocabulary-building, and searching capabilities. Use of FAMULUS in preparing a summary of sedimentation research in the United States is illustrated. (Knapp-USGS)

MEAN LONG-TERM WATER BALANCE OF MOUNTAIN WATERSHEDS BASED ON
THE DATA OF TRANSCARPATHIAN GAGING STATIONS (RUSSIAN),
W69-09171 02E

NORMAL ANNUAL PRECIPITATION IN THE WESTERN SIBERIAN PLAIN
AND NORTHERN KAZAKHSTAN (RUSSIAN),
W69-09172 02B

INVESTIGATIONS OF UNSTEADY WATER FLOW AND RIDGE-LIKE
SEDIMENT DISPLACEMENT (RUSSIAN),
W69-09173 02E

SWEDISH NATURAL SCIENCE RESEARCH COUNCIL, STOCKHOLM.
GROUNDWATER PROBLEMS,
W69-09282 02F

SYDNEY UNIV. (AUSTRALIA). DEPT. OF SOIL SCIENCE.
THE POTENTIOMETRIC ESTIMATION OF CHLOIDE IN WATER EXTRACTS
OF SOILS,
W69-09145 02K

TECHNION - ISRAEL INST. OF TECH., HAIFA.
OPTIMAL CONTROL OF A STORAGE RESERVOIR DURING A FLOOD
SEASON,
W69-09370 04A

THE OPTIMAL YIELD OF AN AQUIFER,
W69-09371 06A

SYSTEMS ENGINEERING AND AQUIFER MANAGEMENT,
W69-09373 06A

TECHNION - ISRAEL INST. OF TECH., HAIFA. DEPT. OF
AGRICULTURAL ENGINEERING AND ELBIT COMPUTERS LTD., HAIFA
(ISRAEL).
OPTIMIZATION OF WATER PLANNING USING A SPECIAL PURPOSE
COMPUTER,
W69-09367 06A

TECHNISCHE HOCHSCHULE, AACHEN (WEST GERMANY).
LOCAL AND REGIONAL MINERALIZATION OF KARST GROUNDWATERS AND
THEIR VARIATIONS IN THE DEVONIAN LIMESTONES OF THE RHINE
SCHISTOSE MOUNTAINS,
W69-09298 02F

TENNESSEE GAME AND FISH COMMISSION.
OBSERVATIONS ON THE INFLUENCE OF THE NEW JOHNSONVILLE STEAM
PLANT ON FISH AND PLANKTON POPULATIONS,
W69-09321 05C

TENNESSEE VALLEY AUTHORITY, KNOXVILLE.
HYDRAULICS OF CIRCULATING SYSTEMS,
W69-09319 08C

TEXAS TECHNOLOGICAL COLL., LUBBOCK.
SOCIAL AND ECOLOGICAL IMPLICATIONS OF WATER IMPORTATION INTO
ARID LANDS,
W69-09218 06G

TOHOKU UNIV., SENDAI (JAPAN). FACULTY OF SCIENCE.
DISTRIBUTION OF HEAVY RAINFALL FREQUENCY AND ITS SEASONAL
TRANSITION IN TOHOKU DISTRICT,
W69-09149 02B

THERMAL INFLUENCE OF THE LAKE INAWASHIRO ON THE LOCAL-
CLIMATE IN SUMMER DAYTIME,
W69-09150 02H

TORONTO UNIV. (ONTARIO). DEPT. OF ZOOLOGY.
THE PHOSPHORUS FRACTIONS AND THE TURNOVER TIME OF INORGANIC
PHOSPHORUS IN DIFFERENT TYPES OF LAKES,
W69-09342 02H

TORONTO UNIV. (ONTARIO). LAB. FOR EXPERIMENTAL LIMNOLOGY.
PREFERRED TEMPERATURE OF RAINBOW TROUT (SALMO GAIRDNERI
RICHARDSON) AND ITS UNUSUAL RELATIONSHIP TO ACCLIMATION
TEMPERATURE,
W69-09040 05C

TRW SYSTEMS GROUP, REDONDO BEACH, CALIF. AND SAN BERNARDINO
VALLEY MUNICIPAL WATER DISTRICT, CALIF.
MAKING ANALYTICAL TOOLS IN WATER RESOURCES MANAGEMENT
USABLE,
W69-09189 06A

TRW SYSTEMS, REDONDO BEACH, CALIF. AND TRW SYSTEMS,
HOUSTON, TEX.
THE APPLICATIONS OF THE TECHNIQUES OF SPACE TECHNOLOGY TO
WATER RESOURCE CONTROL,
W69-09368 06A

UNITED NATIONS DEVELOPMENT, NEW YORK.
GENERAL REPORT ON THE GROUNDWATER INVESTIGATION OF THE AZRAQ
BASIN.
W69-09200 02F

UNITED NATIONS EDUCATIONAL, SCIENTIFIC AND CULTURAL
ORGANIZATION, NEW YORK AND ECONOMIC COMMITTEE FOR ASIA AND
FAR EAST.
METHODS AND TECHNIQUES OF GROUND-WATER INVESTIGATION AND
DEVELOPMENT,
W69-09197 02F

UNIVERSITY COLL. OF TOWNSVILLE (AUSTRALIA). DEPT. OF ENGINEERING.
NUMERICAL SOLUTIONS OF THE NAVIER STOKES EQUATION FOR FLOW THROUGH IDEALIZED POROUS MATERIALS,
W69-09278 02F

UNIVERSITY COLL., CORK (IRELAND).
PROBLEMS IN SIMULATING AND EVALUATING VARIOUS METHODS OF LINEAR FLOOD ROUTING USING A SMALL DIGITAL COMPUTER,
W69-09188 07C

UNIVERSITY OF WESTERN ONTARIO, LONDON AND ILLINOIS STATE GEOLOGICAL SURVEY, URBANA.
SANITARY LANDFILL DESIGN,
W69-09235 05E

UTAH WATER RESEARCH LAB., LOGAN. DEPT. OF CIVIL ENGINEERING.
SIMULATION OF THE HYDROLOGIC-ECONOMIC FLOW SYSTEM,
W69-09185 07C

ADAPTION OF ELECTRONIC COMPUTER FOR IMPROVED METHOD OF MODELING SURFACE RUNOFF FROM RAINFALL FOR SMALL WATERSHEDS,
W69-09186 07C

VERMONT UNIV., BURLINGTON. DEPT. OF BOTANY.
THE FLORENCE FLOODS,
W69-09132 02E

WASHINGTON UNIV., SEATTLE.
WATER TRANSFERS.
W69-09325 06D

WASHINGTON UNIV., SEATTLE. DEPT. OF OCEANOGRAPHY.
OXYGENATION OF HYDROGEN SULFIDE IN SEAWATER AT CONSTANT SALINITY, TEMPERATURE, AND PH,
W69-09231 02K

WASHINGTON UNIV., SEATTLE. DEPT. OF SANITARY ENGINEERING.
A NEW CRITICAL PHASE OF THE LAKE WASHINGTON POLLUTION PROBLEM,
W69-09339 05G

WASHINGTON UNIV., SEATTLE. DEPT. OF ZOOLOGY.
WATER-QUALITY MANAGEMENT AND LAKE EUTROPHICATION THE LAKE WASHINGTON CASE,
W69-09349 05G

WATER PLANNING FOR ISRAEL LTD., TEL AVIV.
A CONCEPTUAL MODEL OF KARSTIC EROSION BY GROUNDWATER,
W69-09296 02J

WATER PLANNING FOR ISRAEL LTD., TEL AVIV.
A CONCEPTUAL MODEL OF KARSTIC EROSION BY GROUNDWATER,
W69-09296 02J

WATER RESEARCH ASSOCIATION, MEDMENHAM (ENGLAND).
DETERMINATION OF MIXING LENGTHS IN DILUTION GAUGING,
W69-09177 02E

ALTERNATIVE DIGITAL COMPUTER APPLICATIONS TO EVALUATE LI WATER RESOURCES,
W69-09273 07C

A COMPUTER PROGRAM FOR ESTIMATING REGRESSIONS BETWEEN TI SERIES,
W69-09274 07C

WATER RESOURCES COUNCIL, WASHINGTON, D.C.
PANEL DISCUSSION-INTRODUCTORY REMARKS,
W69-09222 06D

WATERLOO UNIV. (ONTARIO).
MOTIONS IN A MODEL GREAT LAKE DUE TO A SUDDENLY IMPOSED WIND,
W69-09046 02H

WIND-DRIVEN SUMMER CIRCULATION IN THE GREAT LAKES,
W69-09308 02H

LARGE-SCALE MOTION IN THE GREAT LAKES,
W69-09310 02H

WISCONSIN UNIV., MADISON. DEPT. OF SOILS.
LINDANE ADSORPTION BY LAKE SEDIMENTS,
W69-09167 05B

DEGRADATION OF GAMMA - BHC IN SIMULATED LAKE IMPOUNDMENT AFFECTED BY AERATION,
W69-09227 05C

DETERMINATION OF SOIL CATION EXCHANGE CAPACITY BY A SIMP SEMIMICRO TECHNIQUE,
W69-09346 02K

WISCONSIN UNIV., MADISON. LIMNOLOGY LAB.
STUDIES ON THE DISTRIBUTION OF COBALT IN LAKES,
W69-09255 02H

WISCONSIN UNIV., MILWAUKEE. CENTER FOR GREAT LAKES STUDIE A HORIZONTAL WATER SAMPLER FOR INVESTIGATION OF STRATIFI WATERS,
W69-09257 02H

WOLF RESEARCH AND DEVELOPMENT CORP., RIVERDALE, MD. DEPT. OF SPECIAL STUDIES.
ANALYSIS OF SERIALS RELATED TO WATER RESOURCES,
W69-09258 10

YALE UNIV., NEW HAVEN, CONN. AND DARTMOUTH COLL., HANOVER
ANALYSIS OF SERIALS RELATED TO WATER RESOURCES,
W69-09258 10

YALE UNIV., NEW HAVEN, CONN. AND DARTMOUTH COLL., HANOVER N.H.
RESPONSE OF CHEMOAUTOTROPHIC NITRIFIERS TO FOREST CUTTIN

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 2, NUMBER 23
DECEMBER 1, 1969

W69-09447 -- W69-09878

UNIV. OF ILL. URBANA-CHAMPAIGN

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 2, NUMBER 23
DECEMBER 1, 1969

W69-09447 -- W69-09878

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

UNIV. OF ILLINOIS LIBRARY

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

UNIV. OF ILL. URBANA-CHAMPAIGN

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

OREWORD_____iii

UBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SORPTION OF WATER ON SILICA,
rning Glass Works, N.Y.
Hertl, and M. L. Hair.
ture, Vol 223, No 5211, p 1150-1151, Sept 13, 9. 2 p, 2 fig, 5 ref.

scriptors: *Water structure, *Water chemistry, lica, *Adsorption, *Thermodynamics, Viscosi-Condensation, Interfaces, Hydrogen bonding. ntifiers: *Water polymers, Adsorption herms.

ter was condensed on a silica surface from ich all freely vibrating hydroxyl groups were noved, to study a possible structure of anoma-s water or water polymer. In 9 runs in which ter vapor was progressively admitted to the tem, 2 distinct knees appeared on the adsorption therm, corresponding to adsorption of 1 and 3 lecules adsorbed on H-bonded surface hydroxyl ups. A third knee at 17 torr corresponds to ad-ption of a third water layer on the silica surface. e number of layers at saturation is estimated to 6. A flat hexagonal structure composed of 6 ter molecules in 3 layers is proposed. If the ucture were released from the surface it could duce a polymeric species with the high viscosity ociated with the anomalous water reported el-here, although the models of structure differ in t the previously reported hexameric structure is ahedral rather than hexagonal-planar. ntifiers: Interfacial tension, Magnetic suscepti-ty, Surface chemistry.

gnetic susceptibility and interfacial tension of er-hexane and water-decane systems were stu-d to determine whether thermal irregularities in magnetic susceptibility of water are due to bulk nterfacial effects. Experimental data are shown hically. In all runs irregularities always ap-red at the same temperatures, within 0.5 deg C, oth interfacial tension and in magnetic suscepti-y. The interfacial origin of the anomalies is also wn by magnetic data of samples of water-silica systems. The irregularities are probably caused, ll systems studied, by ordered water structure at phase interfaces. (Knapp-USGS)

POLYWATER,
Maryland Univ., College Park. Center for Materials Research; and National Bureau of Standards, Washington, D.C.
E. R. Lippincott, R. R. Stromberg, W. H. Grant, and G. L. Cessac.
Science, Vol 164, No 3887, p 1482-1487, June 1969. 6 p, 5 fig, 1 tab, 19 ref.

Descriptors: *Water structure, *Water chemistry, *Surfaces, *Hydrogen bonding, Molecular structure, Water properties, Absorption, Infrared radiation, Thermodynamics, Thermal properties.
Identifiers: *Anomalous water, *Polywater, Water polymers, Raman spectra, Infrared absorption spectra.

Recent reports of anomalous water or polywater by Russian and U.S. workers are reviewed and results of a study by the U.S. Bureau of Standards and the University of Maryland are discussed. The infrared and Raman spectra of a form of water prepared in fused quartz capillaries and previously designated as 'anomalous' water have been obtained. The infrared spectra appear to be unique, with the apparent absence of the O--H-stretching bands prominent in normal water spectra, and the appearance of new bands near 1600 and 1400 cm. The interpretation is that new and previously unreported strong symmetric O-H-O bonds are formed. These bonds are regarded as responsible for the remarkable properties of the material and have considerable covalent character. They are so strong that they cannot be considered as normal hydrogen bonds. The bond energy per O-H-O unit is given as approximately 125 to 210 kjoule/mole (30 to 50 kcal/mole), and an energy of 250 to 420 kjoules (60 to 100 kcal) per structural unit. Several structures are proposed which are consistent with the spectral data and the remarkable properties and stability of the material. It is concluded that the material is a true polymer of water and, therefore, is named polywater. (Knapp-USGS)

THE USE OF SINGLE-PARAMETER DENSITY MODELS TO STUDY THE THERMOHALINE CIRCULATION IN AN OCEAN OF FINITE DEPTH,
University of the Far East.
V. F. Kozlov.
Atmos and Oceanic Phys, Vol 4, No 6, p 354-360, June 1968. 7 p, 2 fig, 1 tab, 26 ref. Transl from Izv, Akad Nauk, SSSR, Atmos and Okean Fiz, Vol 4, No 6, p 622-633, 1968.

Descriptors: Ocean circulation, *Salinity, *Density, *Mathematical models, Ocean currents, Diffusion, Mixing, Convection, Oceanography, Water circulation, Density currents.
Identifiers: USSR, Thermohaline circulation.

A general procedure is suggested for the use of single-parameter density models to solve the problem of the stationary circulation in an ocean of finite-depth. The equation obtained is solved numerically by computer. The depth distribution of the baroclinic layer in a rectangular ocean is computed. (Knapp-USGS)

CALCULATING THE GENERAL CIRCULATION AND CURRENTS IN THE NORTHWESTERN BLACK SEA,
Akademiya Nauk SSSR; and Gidrometeorologicheskii Institut, Odessa (USSR).
D. M. Tolmazin, and V. A. Shnaydman.
Atmos and Oceanic Phys, Vol 4, No 6, p 361-368, June 1968. 8 p, 8 fig, 1 tab, 13 ref. Transl from Izv, Akad Nauk, SSSR, Atmos and Okean Fiz, Vol 4, No 6, p 634-646, 1968.

Descriptors: *Ocean circulation, *Ocean currents, *Hydrologic budget, *Salinity, *Winds, *Inflow, Topography, Mass transfer, Mathematical models, Digital computers, Water circulation, Oceanography, Waves (Water).
Identifiers: *Black Sea, *USSR.

The general circulation in the northwestern Black Sea is calculated from the known wind field, river discharge, and bottom relief, taking account of the exchange of water with the open sea. A model of

steady homogeneous-fluid motion is used for the calculation. Observational data are used in making preliminary estimates of the horizontal grid spacing and of the accuracy of the solution. The stream function is calculated by Seidel's method. Patterns of the stream functions, surface currents, and free-surface relief are given for several wind situations in the northwestern Black Sea. Various factors affecting the process are analyzed. (Knapp-USGS)

METHODS OF STRUCTURAL AND GEOMORPHOLOGICAL ANALYSIS OF RIVER VALLEYS (RUSSIAN),
Kharkov State Univ. (USSR).
I. G. Chervanov.
Kharkov Univ, Vestnik Geol i Geogr, Ser No 25, No 2, p 83-85, 1967. 3 p.

Descriptors: *Geomorphology, *Mathematical studies, *Geologic control, *Structural geology, River basins, Topography, Slopes, Streamflow, Sediments, Floods, Maps, Mapping, Methodology.
Identifiers: *USSR, Terrace profile, Geomorphological methods.

Various structural and geomorphological elements of the Styr and Ikva River valleys were analyzed and plotted on the same map. These plotted elements consisted of (1) a longitudinal stream profile; (2) graphs characterizing the forms of transversal profiles; (3) geologico-geomorphological profiles of river terraces; and (4) the geomorphological scheme of the river valley. The longitudinal profiles of the rivers were analyzed using the concepts of deformation coefficient and coefficient of stream slope developed by Yu. A. Mescheryakov and then plotted on the map. The study shows that the combination of these geomorphological and geological profiles permits the evaluation of the tectonic processes acting in the past as well as the evaluation of the thicknesses and lithological characteristics of the formations present in a river valley. A PRELIMINARY REPORT ON AN EMPIRICAL ANALYSIS OF DRAINAGE NETWORK ADJUSTMENT TO PRECIPITATION INPUT,
Idaho Univ., Moscow.
Roy E. Williams, and Phillip M. Fowler.
J Hydrol, Vol 8, No 2, p 227-238, June 1969. 12 p, 2 fig, 1 tab, 13 ref.

Descriptors: *Rainfall-runoff relationships, *Geomorphology, *Drainage density, Erosion, Hydrogeology, Streams, Terrain analysis, Topography, Model studies, Surveys, Discharge (Water), Streamflow.
Identifiers: Drainage basin analysis.

In an analysis of the effect of precipitation on drainage network adjustment and on cumulative stream discharge, seven 4th-order drainage basins in each of 2 areas were investigated. Both areas are covered by glacial till and have similar precipitation intensities and thunderstorm frequencies, but one area receives approximately 30% greater average annual precipitation than the other,. Values of certain geomorphic parameters were determined for each basin and these values were compared statistically. As might be expected from considerations based on Horton's law the number of segments per order per unit area of a 4th-order basin in the wetter area is systematically related to that in the drier area. The analysis indicates that a basin of a given order in the drier area contains more segments of every order than does a basin of the same order in the wetter area. But on a unit area basis more segments per order per unit area of 4th-order basins occur in the wetter area. Runoff data indicate that cumulative stream discharge per segment per order per unit area should be appreciably greater in the wetter area than in the drier area. On the basis of data collected from the 2 areas it appears that some variable other than precipitation, materials, evapotranspiration, and precipitation intensity is operative in the adjustment process. This variable may be initial relief. (Knapp-USGS)
W69-09671

A COMPREHENSIVE RAINFALL/RUNOFF MODEL FOR AN UPLAND CATCHMENT AREA,
Dee and Clwyd River Authority (Wales).
A. O. Lambert.
J. Inst Water Eng, Vol 23, No 4, p 231-238, June 1969. 8 p, 4 fig, 2 tab, 6 ref.

Descriptors: *Rainfall-runoff relationships, *Routing, Streamflow forecasting, Recession curves, Hydrographs, Hydrograph analysis, Water storage, Streamflow, Water balance, Mathematical models, Model studies.
Identifiers: *Wales, Watershed models.

Using hydrometric data from an upland river in North Wales, a relationship between rate of river flow and water stored within the catchment area (catchment storage) is assumed to exist, and is evaluated from an analysis of winter recession curves. This storage/river flow relationship, when combined with water balance equations, produces a set of equations which may be used for routing inputs of rainfall through a storage with defined outflow characteristics, providing a straightforward method of flood prediction and analysis from rainfall data. Recorded and predicted flood hydrographs are compared, and the effectiveness and limitations of the method are considered. The development of a complete mathematical model, embodying the storage/river flow relationship, and suitable for generation of continuous run-off records from rainfall and evaporation data, is also considered. (Knapp-USGS)

CALIBRATING A WATERSHED BY USING A CLIMATIC DATA,
Forest Service (USDA), Upper Darby, Pa. Northeastern Forest Experiment Station.
Irvin C. Reigner.
USDA Forest Service, Research Paper NE-15, 45 p, illus, 1964.

Descriptors: *Hydrograph analysis, *Watershed management, *Calibrations, *Rainfall-runoff relationships, Storm runoff, Watersheds (Basin), Antecedent precipitation, Evapotranspiration, Climatic data, Pennsylvania, Estimating equations.
Identifiers: *Experimental watersheds, Hydrologic analysis, Groundwater storage, Soil moisture storage, Climatic variables.

In a single-watershed calibration of the experimental Dilldown Watershed in Pennsylvania, equations were developed for predicting annual runoff and monthly water loss or runoff. The basic relationships were developed from streamflow, climatic, groundwater, and soil-moisture records, but the final equations were expressed in terms of runoff and climatic variables only.

OWTH MODE OF ICE CRYSTALS IN AIR LOW PRESSURE,
oya Univ. (Japan). Water Research Lab.
ji Isono, and Kunimoto Iwai.
ure, Vol 223, No 5211, p 1149-1150, Sept 13, 9. 2 p, 3 fig, 5 ref.

criptors: *Ice, *Crystal growth, *Cloud physics, limation, Water properties, Laboratory tests, stals, Freezing, Condensation, Nucleation, nperature, Pressure, Humidity.
ntifiers: *Ice clouds, Noctilucent clouds, Nacre-clouds.

n study of the formation of noctilucent and reous clouds, ice crystals were grown on a metal ace in a vacuum cryostat. The cryostat was ntained at pressures from 0.1 to 0.000001 mm Hg. At pressures lower than 0.1 mm, crystals w in spherically symmetric, transparent, specu-form. Neither edge growth nor skeleton struc-s were observed. Air bubbles were not in-led. With fixed values of supersaturation and perature, radius increase was linear. At tem-tures between -50 deg C and -80 deg C, values ne sublimation coefficient were about 0.06, and ow 80 deg C the value increased with decreasing perature. At pressures as low as .01 to .001 , ice particles are roughly spherical; needle-ped crystals can apparently be grown only on dle-shaped nuclei. It is concluded that ice crystal growth in mesospheric and high-stratospheric conditions differs from growth in tropospheric conditions. This should be taken into account in the study of noctilucent and nacreous clouds. (Knapp-USGS)

EFFECT OF ICE CONCENTRATION ON THE SEA SURFACE TEMPERATURE,
Arkticheskii i Antarkticheskii Nauchno-Issledovatelskii Institut, Leningrad (USSR).
A. S. Denisov.
Transl by Scripta-Technica from Okeanologiya, Akad Nauk, SSR, Vol 8, No 4. Oceanology, Vol 8, No 4, p 473-476, 1968. 4 p, 1 fig, 4 tab, 1 ref.

Descriptors: *Water temperature, *Ice loads, *Statistical methods, Regression analysis, Correlation analysis, Sea ice, Seawater, Arctic.
Identifiers: *Ice concentration in sea, *Temperature forecasting, Arctic Sea.

Statistical relationships between surface water temperature and ice concentration were obtained in one of the Arctic Seas. As a general rule the greater the ice concentration, the lower the surface water temperature. Preliminary analysis of the data revealed regional differences in temperature for the same ice coverage which was greater from north to south than from east to west. Further, regression equations showed that the absolute effects of ice in determining the water temperature decreased from July to September. The decrease was particularly rapid at the beginning of the cooling period. The correlation coefficients for August and September were 0.40 and 0.32 respectively. This would indicate that other factors may be important in determining the relationships between surface water temperature and ice concentrations. These studies are important in developing charts of mean water temperature and in temperature forecasting necessary in navigation. (Carstea-USGS)

2D. Evaporation and Transpiration

GENERATION OF AN EVAPORATION TIME SERIES FOR LAKE ONTARIO,
Cornell Univ., Ithaca, N.Y.
Shaw Lei Yu, and Wilfried Brutsaert.
Water Resources Res, Vol 5, No 4, p 785-796, Aug 1969. 12 p, 3 fig, 4 tab, 26 ref. OWRR Project A-009-NY.

Descriptors: *Evaporation, *Time series analysis, *Mass transfer, Hydrologic data, Statistical models, Hydrologic budget, Climatic data, Climatology, Lake Ontario.
Identifiers: Evaporation time series.

Monthly mean values of evaporation from Lake Ontario for the period from 1872 to 1965 inclusive were generated by a mass transfer procedure. Available onshore recorded meteorologic data were adjusted to obtain approximate over lake values with empirically derived equations. The mass transfer coefficient was calculated by using an equation proposed by Harbeck relating the coefficient with water surface area. A comparison of the generated mass transfer evaporation data with water budget estimates obtained by Morton revealed that on the average the 2 methods gave similar results. (Knapp-USGS)

EVAPORATION FROM A SIMULATED SOIL SHRINKAGE CRACK,
Agricultural Research Service, Temple, Tex. Soil and Water Conservation Research Div.; and Agricultural Research Service, Big Spring, Tex. Soil and Water Conservation Research Div.
John E. Adams, Joe T. Ritchie, Earl Burnett, and D. W. Fryrear.
Soil Sci Soc Amer Proc, Vol 33, No 4, p 609-613, July-Aug 1969. 5 p, 4 fig, 2 tab, 6 ref.

Descriptors: *Evaporation, *Soil moisture, *Cracks, *Shrinkage, *Laboratory tests, Model studies, Winds, Evaporation control, Mulching, Water conservation, Soil management, Water management (Applied).
Identifiers: Soil shrinkage cracks.

A simulated soil shrinkage crack, 46 cm wide and 62 cm deep, was constructed in such a manner that depth could be varied by 15.2-cm increments and width could be adjusted between 10 and 70 mm by 20-mm intervals. The walls of the crack were lined with porous ceramic plates connected to a water supply maintained at -5 mb potential. The simulated crack was installed in the floor of a laboratory wind tunnel located in a controlled environment room maintained at 24.0 C air temperature and 43% relative humidity. Evaporation from the simulated crack walls (ceramic plates) was determined for all combinations of four crack widths (10, 30, 50, and 70 mm), three crack depths (30, 45, and 60 cm) and five windspeeds (0, 2.2, 4.5, 6.7, and 8.9 m sec). Total water loss (evaporation) from the walls of the simulated crack increased as any one or all of the three variables (windspeed, crack depth, or crack width) increased. These three variables accounted for 99.1% of the variability in total evaporation from the crack walls. Turbulent air movement within the simulated crack was the major factor affecting the evaporation. Both straw and gravel mulches reduced evaporation from the crack walls 85 to 90% with no wind and about 60% at 8.9 m per sec windspeed. The results suggest that evaporation from soil shrinkage cracks may be reduced by closer plant or row spacing or by surface residues such as trash and clod mulches. Total evaporation from a simulated crack 60 cm deep varied from 0.5 cm per hr (10 mm wide, 0 m per sec windspeed) to 18 cu m per hr (70 mm wide, 8.9 m per sec windspeed). In simulated cracks 60 cm deep and 30-70 mm wide, 50-60% of the total evaporation occurred below 15 cm and 30-40% occurred below 30 cm. (Knapp-USGS)
W69-09488

EVAPOTRANSPIRATION FROM TWO PEAT-LAND WATERSHEDS,
Forest Service (USDA), Grand Rapids, Minn. North Central Experiment Station.
Roger R. Bay.
Int Ass Sci Hydrol Pub No 78, Gen Assembly of Bern, Sept-Oct 1967, p 300-306, 1967. 7 p, 1 fig, 4 tab, 14 ref.

Descriptors: *Evapotranspiration, *Bogs, *Water balance, *Swamps, *Peat, Evaporation, Transpiration, Water table, Water level fluctuations, Saturated soils, Streamflow, Consumptive use, Minnesota.
Identifiers: *Peatlands, Spruce forests, Potential evapotranspiration.

Measurements of precipitation, runoff, and bog water table levels have provided data for the calculation of evapotranspiration from two forested peatland watersheds near Grand Rapids, Minnesota (ca. 47 deg 31 min N, 93 deg 28 min W). Continuous hydrologic records were collected on one experimental bog for 6 years (1961-1966) and on the other for the past 2 years (1965-1966). Water level changes in each bog were converted to inches-depth of storage by water yield coefficients for specific peat horizons and used to adjust precipitation-runoff calculations. Evapotranspiration estimates for the growing-season period May 1 to November 1 ranged from 87 to 121 percent of potential evapotranspiration computed by the

Thornthwaite method. Midsummer evapotranspiration totals (June 1 to September 1) were 70 to 99 percent of potential evapotranspiration. Mean daily evapotranspiration values from both bogs during short summer drying periods were consistently less than the calculated potential values.

POTENTIAL EVAPOTRANSPIRATION AND CLIMATE IN ALASKA BY THORNTHWAITE'S CLASSIFICATION,
Pacific Northwest Forest and Range Experiment Station, Juneau, Alaska. Inst. of Nothern Forestry; and State Univ., of New York, Syracuse. Dept. of Watershed Management.
James H. Patric, and Peter E. Black.
US Forest Serv Res Pap PNW-71, 1968. 28 p, 4 fig, 2 tab, 19 ref.

Descriptors: *Evapotranspiration, *Alaska, Water balance, Hydrologic budget, Humidity, Climates, Temperature, Cold regions, Data collections, Climatic data.
Identifiers: *Thornthwaite method.

Estimates and measurements of potential evapotranspiration in Alaska by Thornthwaite's methods showed good agreement with estimates and measurements by other methods. Natural vegetation is closely related to climate. Vegetation distribution in the interior seems governed more by temperature than by moisture availability. The available data heavily bias classifications of climate to sea-level and valley-bottom conditions. (Knapp-USGS)
W69-09698

A METHOD OF ESTIMATING STREAMFLOW LOSS BY EVAPOTRANSPIRATION FROM THE RIPARIAN ZONE,
Forest Service (USDA), Upper Darby, Pa. Northeastern Forest Experiment Station.
Irvin C. Reigner.
Forest Science, Vol 12, No 2, June 1966.

Descriptors: *Evapotranspiration, *Riparian water loss, *Watersheds (Basins), Diurnal distribution, Streamflow forecasting, Hydrograph analysis, Base flow, Low flow, Surface-groundwater relationships, Estimating equations, Pennsylvania.
Identifiers: *Experimental watersheds, Hydrologic analysis.

Conservative values of daily streamflow loss by evapotranspiration from the riparian zone were obtained by hydrograph analysis. The two highest peaks of a series of diurnal fluctuations were connected by a straight line, representing the potential groundwater flow for a series of days between storm flows. The series should ideally be no longer than 5 days. After sufficient number of daily riparian water losses were obtained, they were used as observations for the dependent variable in multiple-regression analysis. In this investigation, 62 samples, occurring during June, July, and August in 1955 and 1956, were used. An estimating equation was derived, using as predictor variables: (1) the one-half powers of mean daily streamflow in c.f.s., and (2) the one-half powers of weighted vapor-pressure deficit. The two individual variables were subsequently eliminated by their product interaction. The equation estimated riparian water loss with a relatively high degree of accuracy; 76 percent of the total variation was removed by the single complex variable.

CHARACTERISTIC RESPONSE TIMES DESIGN FLOOD ESTIMATION,
New South Wales Univ., Kensington (Austr and Ministry of Public Works (Cambodia).
Federick C. Bell, and Songthara Om Kar.
J Hydrol, Vol 8, No 2, p 173-196, June 1969. 8 fig, 6 tab, 21 ref.

Descriptors: *Rainfall-runoff relationships, *F forecasting, *Design flood, *Routing, Stream forecasting, Water management (Applied), Hy graphs, Unit hydrographs, Hydrograph ana Mathematical models, Estimating.
Identifiers: Watershed response time.

In design flood estimation, characteristic resp times are required for the determination of h graph parameters and critical durations of f producing rainfall. Dimensionless hydrograph useful for design purposes and it appears that of these may be approximated by a single, si mathematical equation expressed in terms o rise time or time to peak. The rise time, tir concentration, lag, time to equilibrium, volume/peak ratio have been suggested as propriate characteristic times. These shoul governed mainly by the physical configuratio the catchments concerned but some are evid also affected significantly by the storm types durations and intensities of rainfall. The critic is suggested as a convenient characteristic time may be related to each of the other characte times. Under most circumstances the critical a suitable value for the critical duration of d rainfall. Several equations for estimating ch teristic times from catchment parameters presented but none of these is completely sati tory. (Knapp-USGS)

escriptors: *Droughts, *Forecasting, *Statistical ethods, Stochastic processes, Precipitation (At-ospheric), Time series analysis, Regression analy-s, Monto Carlo method, Mathematical models, noptic analysis.
entifiers: Statistical runs, Continental droughts.

ethods are outlined for an objective definition of rge continental droughts. The phenomenon termining drought, the variable which properly scribes this phenomenon, the moisture level at hich a drought starts, and the area to which a ought is related are defined. Runs as statistical operties of time and space distribution of water ficits are recommended as parameters for ought definition. Run-length of negative devia-ns of a time series (duration of drought) run-sum negative deviations between a downcross and an ocross of a time series (severity of a drought) and ea-run as the deficit of water over a time duration un-length), and area drought are proposed as finitions of droughts. The runs can be deter-ined either analytically for simple cases or by the onte Carlo Method for more complex cases. Examples for these 2 methods are given. A review is made of results obtained at Colorado State University in the last 4 to 5 yr on the properties of precipitation, effective precipitation and runoff which affect the description of droughts and the outlook for drought prediction. An approach is proposed for prediction of large continental droughts by the search for an interrelationship of oceanic synoptic situation and continental precipitation. Some measures are explored which offer a possibility for combating large droughts. (K-napp-USGS)

WATER RESOURCES OF PULASKI AND SALINE COUNTIES, ARKANSAS,
Geological Survey, Washington, D.C.
Raymond O. Plebuch, and Marion S. Hines.
Geol Surv Water-Supply Pap 1839-B, p B1-B25, 1967. 25 p, 2 fig, 1 plate, 5 tab, 27 ref.

Descriptors: *Water resources, *Arkansas, Groundwater, Surface waters, Streamflow, Rivers, Reservoirs, Water yield, Water wells, Water quality, Aquifers, Hydrogeology, Hydrologic data, Data collections.
Identifiers: Pulaski County (Ark), Saline County (Ark).

Pulaski and Saline Counties constitute an area of 1,506 sq mi in the geographic center of Arkansas. The area is divided into a hilly western part, known as the Interior Highlands, and a relatively flat eastern part, known as the Coastal Plain. In the Interior Highlands, surface water offers greater possibilities than groundwater for water supplies. Alum Fork, Middle Fork, and North Fork of the Saline River offer excellent impoundment possibilities and will yield water of good quality. In addition, with storage, many of the smaller streams are suitable for development of small supplies. In contrast, in the Coastal Plain it is easier to develop groundwater than surface water in relatively large quantities. Two aquifers, units 3 and 9, yield as much as 350 and 2,000 gpm of water, respectively. A third aquifer, unit 7, is as yet relatively undeveloped in the project area, but yields 860 gpm to a well south of the project area. These aquifers yield water that, with treatment, is suitable for most uses. (Knapp-USGS)
W69-09711

ACCURACY OF DISCHARGE DETERMINATIONS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
W. T. Dickinson.
Colo State Univ Hydrol Pap No 20, June 1967. 54 p, 11 fig, 17 tab, 122 ref. 14-06-D-6007 (Bur Reclam).

Descriptors: *Discharge measurement, *Streamflow, *Discharge (Water), *Reviews, *Bibliographies, Mathematical studies, Statistical methods, Calibrations, Stage-discharge relations, Correlation analysis.
Identifiers: Rating curves.

Errors that may be incurred in discharge determinations made on mountain streams were analyzed. The possible sources of error were carefully considered, and a classification of these sources, including notations on the nature of the resulting errors, was prepared. A mathematical error model for a single discharge measurement was hypothesized, and methodology presented for the evaluation of daily, monthly, and annual discharge estimates. An exhaustive literature review was made. Each component was analyzed separately, and with respect to the others, in order to yield information about the random or systematic nature of the error, and about possible functional relationships which might be involved. This information has been summarized in the form of a classification of errors. A hypothetical error model was developed for a single discharge measurement to reveal the manner of combination of the various component errors, and to clarify the nature of some of the errors. Finally, consideration was given to the errors arising from use of an estimated rating curve, which accounts for virtually all the variability in sample data for 9 mountain stream-gaging stations in Colorado. Rating curves can be separated into two portions, one along which the relative error was virtually constant, and the other along which the absolute error remained constant. Confidence and tolerance limits were established for the estimated curves, and are used for inferences regarding the error bounds on daily discharge estimates and future discharge measurements. (K-napp-USGS)

ENGINEERING JUDGMENT AND SMALL AREA FLOOD PEAKS,
Colorado State Univ., Fort Collins.
Lourens A. V. Hiemstra, and Brian M. Reich.
Colo State Univ Hydrol Pap No 19, Apr 1967. 29 p, 11 fig, 9 tab, 25 ref. Bureau of Reclamation Contract 14-11-0008-0590-62.

Descriptors: *Flood forecasting, *Reviews, *Rainfall-runoff relationships, *Streamflow forecasting, *Runoff forecasting, Rational formula, Small watersheds, Rainfall intensity, Routing, Estimating.
Identifiers: Flood records.

The knowledge of small basin floods and the state of the art of flood predictions on ungaged basins are such that engineering judgement still plays an important role in the determination of a design flood. An appraisal of the reliability of 5 current methods of flood prediction is presented as an aid in developing this faculty. Flood estimates obtained by applying rainstorms estimated to have return periods of from 2- through 200-years were compared. For each of 6 such levels applied to 14 real basins, inconsistencies among 5 methods produced differences in the magnitude of their estimates as great as 300%. Since long flood records for small basins were inadequate, it was necessary to insert observed rainfalls into formulae and design methods. Design estimates based upon recorded rainstorms were compared to 134 observed floods, on 45 mixed-cover agricultural basins ranging in area from 0.12 through 8.16 sq mi. Scatter-diagrams, histograms, and statistics suggest some superiority of the 'Rational' formula, the Bureau of Public Roads method, and the Tacitly Maximized Peak technique in that they generally overestimate floods from this sample. Although variability is less than that of the other 2 methods, underprediction is possible in about a third of the cases. (Knapp-USGS)

QUALITY OF SURFACE WATER IN ILLINOIS, 1956-1966,
Illinois State Water Survey, Urbana. Water Supply Div.
Robert H. Harmeson, and T. E. Larson.
Ill State Water Survey, Urbana, Bull 54, 1969. 184 p, 15 ref.

Descriptors: Alkalinity, Fluoride, *Illinois streams, Manganese, Mineral quality, Nitrate, Phosphate, Radioactivity, Surface water, Temperature, *Total dissolved minerals, Total hardness, Turbidity, *Water quality.

Surface water quality in Illinois has been determined by means of analysis of data from monthly water sampling programs. Sampling programs have spanned periods of approximately 5 years and have been carried on since 1945 for 61 locations on 45 streams and 1 lake. Data analyzed to show frequencies of median and extreme values of certain mineral constituents for specific streams and sampling periods provide base-line values for future water quality and water resource studies. Comparisons are drawn between water quality for the same stations in two or more sampling periods and also for streams or stations in different geographic or physiographic sections of the state. Attention is drawn to temporal changes in mineral constituents and to potential water quality problems.

THEORY OF FLOW IN A CONFINED TWO AQUIFER SYSTEM,
California Univ, Berkeley.
Shlomo P. Neuman, and Paul A. Witherspoon.
Water Resources Res, Vol 5, No 4, p 803-816, Aug 1969. 14 p, 9 fig, 22 ref.

Descriptors: *Groundwater movement, *Aquifers, *Aquitards, *Mathematical models, Drawdown, Permeability, Leakage, Water levels, Withdrawal, Pumping, Water storage, Discharge (Water).
Identifiers: Leaky aquifers, 2-aquifer flow system.

A complete analytic solution has been developed for the problem of flow to a well in a confined infinite radial system composed of 2 aquifers that are separated by an aquitard. The well, which is represented by a line sink, completely penetrates only one of the aquifers and discharges at constant rate. The present solution differs from previous work in that the effects of storage in the aquitard and drawdown in the unpumped aquifer are both considered. Asymptotic solutions for small values of time are also included. The analytic solutions have been evaluated numerically for selected cases. The validity of these solutions has been verified independently using the finite element method of analysis. (Knapp-USGS)
W69-09463

APPLICABILITY OF CURRENT THEORIES OF FLOW IN LEAKY AQUIFERS,
California Univ., Berkeley.
Shlomo P. Neuman, and Paul A. Witherspoon.
Water Resources Res, Vol 5, No 4, p 817-829, Aug 1969. 13 p, 9 fig, 38 ref.

Descriptors: *Groundwater movement, *Aquifers, *Aquitards, *Leakage, *Mathematical models, Drawdown, Permeability, Water levels, Withdrawal, Pumping, Water storage, Discharge (Water), Analytical techniques.
Identifiers: *Leaky aquifer theory.

The applicability of current theories of flow in leaky aquifers has been investigated using new analytic and numeric solutions. In general it has been customary to use one or both of the following assumptions: (1) storage in the aquitards is negligible, and (2) drawdowns in the unpumped aquifers remain zero. At small values of time the first-assumption amounts to neglecting the effects of leakage completely. Errors introduced in this way can become significant when the Beta factor of Hantush exceeds 0.01. It appears that Beta may exceed 0.1 in many field situations. At large values of time, neglecting drawdowns in the unpumped aquifers can also lead to serious errors unless the transmissibilities of these aquifers are significantly greater than that of the pumped aquifer. In addition present methods of analyzing leaky aquifers usually rely only on drawdown data from the pumped aquifer. Such an approach is not sufficient to characterize a leaky system; current methods of analyzing field data from leaky aquifers need to be improved. (Knapp-USGS)
W69-09464

EFFECTS OF BOUNDARY CONDITIONS OF MODELS ON TRACER DISTRIBUTION IN-FLOW THROUGH POROUS MEDIUMS,
Weizmann Inst. of Science, Rehovoth (Israel).
N. D. Gershon, and A. Nir.
Water Resources Res, Vol 5, No 4, p 830-839, Aug 1969. 10 p, 3 fig, 1 tab, 21 ref.

Descriptors: *Groundwater movement, *Flow, *Porous media, *Tracers, Diffusion, Dispersion, Radioactivity effects, Chemical reactions, Mathematical models, Mathematical studies, Hydraulics, Steady flow, Unsteady flow, Distribution.
Identifiers: Tracer behavior in porous media.

Effects of initial and boundary conditions on the distribution of the tracer in time and distance are calculated for several one-dimensional systems (infinite, semi-infinite, and finite) of tagged liquid flowing through a solid matrix, and the effects of hydrodynamic dispersion, diffusion, radioactive decay, and simple chemical interactions of the tracer are included. Exact and approximative solutions show that in most practical conditions the results of steady state experiments are influenced only up to 0.5% by changes in boundary conditions. In nonsteady state, results are influenced up to 5% in the region where the ratio of the measured concentration and the concentration of the solution entering the porous medium is about 0.5. Results are given in non-dimensional form with graphs of representative cases. (Knapp-USGS)
W69-09465

DIFFUSION OF TRAPPED GAS FROM POROUS MEDIA,
Manitoba Univ., Winnepeg; Idaho Univ., Moscow; and Colorado State Univ., Fort Collins.
Kenneth M. Adam, George L. Bloomsburg, and Arthur T. Corey.
Water Resources Res, Vol 5, No 4, p 840-849, Aug 1969. 10 p, 8 fig, 2 tab, 7 ref.

Descriptors: *Flow, *Gases, *Liquids, *Porous media, *Wetting, Groundwater movement, Infiltration, Permeameters, Laboratory tests, Model studies, Hydraulic models, Unsaturated flow, Saturated flow, Diffusion, Porosity, Permeability.
Identifiers: Multiphase flow.

When a gas-filled porous medium is permitted to imbibe liquid from a source at a pressure equal to the initial gas pressure, some of the gas is trapped in the pores and is discontinuous with the atmosphere surrounding the medium. The amount of gas initially trapped varies over a range at least as wide as from about 5 to about 50% of the pore volume. The percentage of trapped gas is gradually reduced to zero as the gas diffuses away under the influence of capillary compression. This happens even though the imbibed liquid is presaturated with the gas initially trapped. Porous media become completely saturated with liquid first at exposed surfaces, and the zone of complete saturation moves continuously toward the interior. (Knapp-USGS)

Descriptors: *Surface-groundwater relationships, *Induced infiltration, *Diffusivity, Hydrologic properties, Aquifers, Permeability, Stage-disch relations, Hydrograph analysis, Mathema models, Digital computers, Simulation analysis.
Identifiers: Aquifer diffusivity, Pumping t Aquifer tests.

The diffusivity of a homogeneous isotropic aqu can be determined from the response in the aqu to fluctuations in river stage. Observed change head in the aquifer are compared with theor head values computed assuming a series of fusivities. These values are generated by appr mating the stage hydrograph as a series of disc steps and summing the influence of each in ment. The diffusivity of the aquifer is calcul from the best-fitting theoretic response curve. fusivities computed for an aquifer at Musquodo Harbour, Nova Scotia, agree with values de mined from pumping test and digital model an sis. THERMAL AND ELECTRICAL CONDUCTI TIES OF SANDSTONE ROCKS AND OCE SEDIMENTS,
Oregon State Univ., Corvallis. Dept. of Ocean raphy; and National Academy of Sciences-Natio Research Council, Washington, D.C. Div. of Ea Sciences.
Jeremy R. Hutt, and Joseph W. Berg, Jr.
Geophysics, Vol 33, No 3, p 489-500, June 19 12 p, 4 fig, 3 tab, 17 ref, 3 append. Contract 1286 (10) ONR. Grant No GP 4642 NSF.

Descriptors: *Conductivity, *Thermal conduct ty, *Electrical conductance, *Electrical stud *Rocks, *Sediments, Hydraulic conductiv Permeability, Porosity, Sandstones, Mineralogy.
Identifiers: Thermal-electric conductivity relati ships.

Relationships between electrical and thermal c ductivities of consolidated sandstone rocks sediments were investigated. Equations given Archie and by Woodside and Messmer combi to give an equation which relates the 2 conduct ties for the rocks. Equations relating conducti and porosity, given by Maxwell, Bruggeman, Woodside and Messmer were combined to giv

ations which relate thermal and electrical con-
ctivities for sediments. Data from 65 rock sam-
s and 105 sediment samples were used in
ablishing the reliability and parameter values of
equations. The derived equation can be used to
ermine thermal conductivities from electrical
nductivities, providing thermal conductivities of
solid constituents can be approximated. For
nples of sandstone rock, deviations of the data
m values predicted by the equations are shown
e related to the variations in composition of the
nples. Within the accuracy of the data, the ther-
l conductivities of sediment samples seem to be
ntrolled more by the water content than by the
neral composition. (Knapp-USGS)

theoretical basis is presented for energy dis-
tion methods of measuring permeability in
rated heterogeneous media. Analysis starts
the equation for single-phase flow in
rogeneous porous media which is a first-order
ial differential equation in the unknown
neability. This equation is reduced to a system
haracteristic equations useful in deriving a dif-
ntial expression for the permeability as a func-
of the known potential distribution. For steady
systems the expression is integrable, giving the
neability integral for direct calculation of the
ribution along successive stream lines. The
ndary condition in permeability is presented
includes a discussion of the special require-
t to assure uniqueness. Theoretical results and
ssary computations are incorporated into two
eral computer programs capable of determining
permeability distribution in 2- and 3-dimen-
al steady flow systems. Results are then presented for an energy dissipation analysis using the methods and software to determine a field permeability thickness distribution. (Gabriel-USGS)

STEADY-STATE FLOW CAPACITY OF WELLS WITH LIMITED ENTRY TO FLOW,
Mobil Research and Development Corp., Dallas, Tex.
A. S. Odeh.
Trans Soc Petrol Eng, Amer Inst Mining, Met, and Petrol Eng, Inc, Vol 243, Part 2, p 43-51, 1968. 9 p, 10 fig, 3 tab, 8 ref, 1 append.

Descriptors: *Aquifers, *Steady flow, *Flow rates, *Water wells, *Flow characteristics, Mathematical studies, Computer programs, Computers, Water supply, Pressure, Boreholes, Water loss, Productivity, Drainage wells, Anistropy, Porous media.
Identifiers: Steady-state flow capacity of wells.

The effect of limited entry to flow at the borehole on the steady-state production of a well is analyzed on the basis of analytical studies of earlier publications and well data. The finite cosine transform was used to arrive at a solution for steady-state flow of a slightly-compressible flow and the solution was programmed for a digital computer. The correct calculation of skin and damage ratio in the presence of limited entry to flow is outlined and calculation of the net decrease in productivity due to the combined effect of limited entry and performations is explained. (Gabriel-USGS)

AREAL SWEEP EFFICIENCY OF PSEUDOPLASTIC FLUIDS IN A FIVE-SPOT HELE-SHAW MODEL,
Shell Development Co., Houston, Tex.
K. S. Lee, and E. L. Claridge.
Trans Soc Petrol Eng, Amer Inst Mining, Met, and Petrol Eng, Inc, Vol 243, Part 2, p 52-62, 1968. 11 p, 9 fig, 3 tab, 36 ref, append.

Descriptors: *Fluid mechanics, *Efficiencies, *Mathematical studies, *Model studies, *Groundwater movement, Velocity, Water circulation, Viscosity, Viscous flow, Oil, Oily water, Porous media, Isotropy, Saturated flow, Tension, Parametric hydrology.
Identifiers: Pseudoplastic fluids, Areal sweep efficiency.

Areal sweep efficiency of oil displacement by enhanced-viscosity water exhibiting pseudoplastic behavior was measured in a Hele-Shaw model representing one-quarter of a five-spot pattern. The pseudoplasticity of polymer solutions and the velocity distribution in the five-spot pattern produced a condition under which the mobility ratio between the displacing and the displaced fluid could not be assigned a single value. Instead, the movement of the displacement front is governed by local mobility ratios which are also time dependent. The areal sweep at breakthrough with polymer solutions was poorer than the sweep obtained with Newtonian fluids of comparable viscosity. However, the areal sweep a 1 PV throughput was greatly improved as compared to flood water without polymer. It was also demonstrated that, even after the oil-cut had declined to a low value during a regular waterflood, switching to polymer flood efficiently swept out the oil remaining in the model. TRANSIENT STRESSES AND DISPLACEMENT AROUND A WELLBORE DUE TO FLUID FLOW IN TRANSVERSELY ISOTROPIC, POROUS MEDIA: 1. INFINITE RESERVOIRS,
Texas Univ., Austin.
M. S. Seth, and K. E. Gray.
Trans Soc Petrol Eng, Amer Inst Mining, Met, and Petrol Eng, Inc, Vol 243, Part 2, p 63-78, 1968. 16 p, 11 fig, 1 tab, 25 ref.

Descriptors: *Stress analysis, *Porous media, *Fluid mechanics, *Water wells, *Groundwater movement, Mathematical studies, Aquifers, Thermal stress, Digital computers, Rocks, Physical properties, Rock properties, Strain, Boreholes, Flow rates, Pressure.
Identifiers: Fluid flow in porous media.

Equations of elasticity for transversely isotropic, axisymmetric, homogeneous, porous media with pore fluid pressure were developed by using an analogy between thermal and porous body stresses. Stress gradients are high near the borehole and die out away from the borehole. Anistropy considerably modifies the states of stress and strain. Radial stresses are compressive or neutral, whereas tangential stresses are tensile, neutral, or compressive, depending upon boundary conditions. In an unbounded system, the vertical stress is essentially proportional to the constant rate of fluid injection at the borehole and decreases with time, whereas the radial and tangential stresses increase with time. At a given location, the radial displacement gradient is dependent upon time. (Gabriel-USGS)

THRESHOLD PRESSURE PHENOMENA IN POROUS MEDIA,
Phillips Petroleum Co., Bartlesville, Okla.; and Michigan Univ., Ann Arbor.
L. K. Thomas.
Trans Soc Petrol Eng, Amer Inst Mining, Met, and Petrol Eng, Inc, Vol 243, Part 2, p 174-184, 1968. 11 p, 11 fig, 4 tab, 18 ref, append.

Descriptors: *Pressure, *Saturation, *Porous media, *Pressure measuring instruments, *Mathematical studies, Analytical techniques, Water, Gases, Permeability, Porosity, Surface tension, Water pressure, Aerial photography.
Identifiers: Underground gas storage, Threshold pressure, Bubbling pressure.

Threshold displacement pressures are needed to determine how much overpressure can be used in storing natural gas. An experimental technique for determining threshold pressures by displacing water with gas from samples saturated with water is presented. Threshold pressures for eight low permeability samples were measured. Threshold pressure data obtained in this work, plus data on higher permeability samples reported in the literature, are correlated with porosity, permeability, surface tension and formation resistivity factor. Mercury injection pressures also were measured and correlated with air-water threshold pressures. Threshold pressures were found to be independent of time. An aerial photograph of gas emerging from the top of a core shortly after its threshold pressure has been exceeded shows that the gas bubbles are uniformly distributed across the face of the core. Channeling will occur, however, when an increased gas phase permeability is reached. (Gabriel-USGS)

SOME CHARACTERISTICS OF HYDROLOGICAL STRUCTURES IN NEW OCCURRENCES OF CARBONACEOUS MINERAL SPRINGS IN THE NORTHERN CAUCASUS (RUSSIAN),
Kharkov State Univ. (USSR).
G. F. Kovalevskiy.
Kharkov Univ, Vestnik Geol i Geogr, Ser No 25, No 2, p 69-74, 1967. 6 p, 7 ref.

Descriptors: *Mineral water, *Spring waters, *Hydrologic properties, *Structures, Carbon dioxide, Geology, Sedimentary rocks, Igneous rocks, River basins, Boreholes, Water levels, Piezometry, Water analysis, Discharge measurement, Sulfates, Sodium, Calcium, Temperature, Fissures (Geology).
Identifiers: *USSR, *Northern caucasus, Carbonaceous mineral springs.

The article describes the hydrologic structure and chemical composition of mineral waters of the North Caucasus springs on the basis of boreholes and field geology data. The study shows that the new occurrences of mineral waters in the Kuma and Podkumok River basins are associated with the Jurassic rocks. The formation and distribution of these carbonaceous mineral waters are associated with the tectonic disturbances and the carbonaceous gas is of deep thermometric origin. The study also shows that the direction of the circulation of these carbonaceous mineral waters obeys the law of circulation of groundwaters in sedimentary rocks. (Gabriel-USGS)

GROUNDWATER AND VEGETATION IN TWO PEAT BOGS IN NORTHERN MINNESOTA,
Forest Service (USDA), Grand Rapids, Minn. North Central Forest Experiment Station.
Roger R. Bay.
Ecology, Vol 48, No 2, p 308-310, Spring, 1967. 3 p, 1 tab, 9 ref.

Descriptors: *Bogs, *Swamps, *Groundwater, *Vegetation, Aquifers, Hydrogeology, Water table, Perched water, Peat, Organic soils, Potholes, Forests, Marsh management, Water quality, Marsh plants, Acidity, Conductivity, Minnesota.
Identifiers: *Peatlands, *Groundwater bogs, *Perched bogs, Bog floristics, Specific conductivity.

Plant cover and water quality of bog waters were related to the surrounding groundwater flow systems in two experimental bogs in northern Minnesota. One bog was considered a perched bog because it was perched above and isolated from the regional groundwater system. The other bog, termed a groundwater bog, was being recharged by the regional flow system. Water in the perched bog ranged from a pH of 4.2 to 4.7, while in the groundwater bog pH ranged from 5.9 to 6.7. Conductivity (micromhos) was also considerably less in the perched bog, varying from 16 to 46, while specific conductivity in the groundwater bog ranged from 44 to 133. Because of the mineral-influenced bog waters, the groundwater bog had a much greater variety and abundance of plant cover, quite typical of the more fertile bog sites. This richness of vegetation was not found in any other perched bog.

Identifiers: Land Drainage.

Solution of the diffusion equation for a line sink in a plane yields the error function. By superposition and integration, functions which describe the transient position and rate of fall of a water table under artificial drainage are developed for multiple drains. These may be used to determine in situ values of transmissivity and storage as well as for discharge. A means of using the method for any initial water table position is presented and some design examples are given. (Knapp-USGS)

entifiers: Wabash River Basin.

he Big Blue River basin, Indiana has an average y-weather yield of 0.27 cfs, one of the highest elds of any river in the Wabash River basin. The ver gains water for the entire distance from its igin to its mouth near Edinburg; along the upper d lowermost reaches of the main stem the scharge often doubles between measuring sites. he smallest gain in discharge occurs in the reach rough the reservoir site. This small gain probably presents a reduction in groundwater discharge e to the relatively small volume of the alluvial quifer and the low permeability of the adjacent l. Also there may be a minor amount of infiltra-on to buried valleys underlying the middle and per portions of the reservoir site. There is no drock exposed in or adjacent to the proposed servoir. Water supply is not a problem in most of e basin at the present time. The water use is for rm, domestic, and small municipal and industrial pplies. Adequate supplies for these purposes are ailable almost anywhere in the basin from oundwater. (Knapp-USGS)
W69-09696

GROUNDWATER APPRAISAL OF THE FLATROCK RIVER BASIN AND DOWNEYVILLE RESERVOIR SITE, INDIANA,
Geological Survey, Washington, D.C.
Dale J. Nyman, and Frank A. Watkins, Jr.
US 90th Congr, 2nd Sess, Senate Doc No 96, Vol 2, Append J, p 304-314, 1968. 11 p, 4 fig, 1 tab.

Descriptors: *Water resources development, *Indiana, Groundwater, Surface waters, Water quality, Streamflow, Dams, Reservoirs, Aquifers, Limestones, Water levels, Water yield, Water storage, Reservoir leakage, Water loss, Hydrologic data, Data collections.
Identifiers: Wabash River Basin.

The main stem of the Flatrock River, Indiana gains water for the entire distance from its origin to its mouth at Columbus. The largest gains occurred in the vicinity of the Lewisville partial record station, the reservoir site, and a few miles north of Columbus. Nevertheless, loss of water from a proposed reservoir is possible where the Flatrock River is cut into bedrock in the pool area, and at the damsite where the proposed dam is underlain by a buried bedrock valley. The exposed bedrock in the reservoir area is an irregularly bedded and jointed dolomite which is probably more permeable than the underlying shales and carbonate rocks. Water supply is not a problem in most of the basin at the present time except at the city of Columbus. Water use in the basin is for farm, domestic, small municipal and industrial supplies. Adequate supplies for these purposes are available almost anywhere in the basin from groundwater. (Knapp-USGS)

SP LOG INTERPRETATION IN SHALY SANDS,
Koninklijke-Shell Exploratie en Produktie Laboratorium, Rijswijk (The Netherlands).
L. J. M. Smits.
Trans Soc Petrol Eng, Amer Inst Mining, Met, and Petroleum Eng, Inc, Vol 243, Part 2, p 123-136, 1968. 14 p, 9 fig, 3 tab, 18 ref.

Descriptors: *Electrical well logging, *Boreholes, *Sands, Rocks, Saline water, Saturation, Mathematical studies, Clays, Porosity, Cation exchange, Permeability, Electrochemistry, Diffusivity, Conductivity, Sodium, Membrane processes.
Identifiers: Spontaneous potential interpretation.

A theoretical equation is developed describing membrane potentials of shaly sands as a function of the cation-exchange capacity per unit pore volume of the rock and saturating water salinity. This equation is based on the same simple physical model as that employed earlier describing the electrical conductivity of shaly sands. Experiments conducted with NaCl solutions showed that the equation is obeyed, except in the case of saturated salt solutions where minor deviations were observed. A possible explanation is given for this discrepancy. As the clay content and the porosity of shales may vary appreciably, shale membrane potentials also vary. It was found that membrane potentials of shales can be calculated accurately with the aid of the same theory. Consequently, changes in membrane potentials can be accounted for by simple measurement of cation-exchange capacities per unit pore volume of both shales and shaly sands. Charts are given to facilitate interpretation of the electrochemical part of the SP in terms of cation-exchange capacities and the salinities of mud filtrate and formation water. (Gabriel-USGS)

GROUNDWATER RESOURCES OF THE BURIED MAHOMET BEDROCK VALLEY,
Illinois State Water Survey, Urbana. Water Supply Div.
Adrian P. Visocky, and Richard J. Schicht.
Ill State Water Survey, Urbana, Report of Investigation 62, 1969. 52 p, 37 fig, 22 tab, 40 ref.

Descriptors: Analog model, *Aquifer characteristics, Aquifer evaluation, *Bedrock valley, Glacial drift, *Groundwater development, Groundwater recharge, Illinois, Leakage, Water wells.

The buried Mahomet Bedrock Valley and its major tributaries cover about 3700 square miles in east-central Illinois, and form a large underdeveloped groundwater resource. The largest source of groundwater consists of Kansan sands and gravels, called the deep aquifer; the Illinoian or middle aquifer is a secondary source. Pumpage was 40.2 mgd in 1965. Major pumping centers are at Champaign-Urbana, Rantoul, Lincoln, Taylorville and Hoopeston; the largest is Champaign-Urbana with pumpage of 13.5 mgd in 1965. Recharge in the

Champaign-Urbana area was computed to be 115,000 gpd/sq mi for the Illinoian aquifer in 1947 and 107,000 gpd/sq mi for the Kansan aquifer during 1953-1965. Total groundwater runoff for the valley is estimated to be about 740 mgd during years of normal precipitation. Existing and/or future pumping centers might capture 445 mgd. An electric analog computer was constructed for the Champaign-Urbana area. Withdrawals with a selected pumping scheme would total 30.3 mgd from existing large capacity wells and 15 mgd from five future wells. This study provides data for planning and development of area groundwater resources.

2G. Water in Soils

NUMERIC STUDIES OF A COMPOSITE SOIL MOISTURE GROUNDWATER SYSTEM,
Drexel Inst. of Tech., Philadelphia, Pa.
G. M. Hornberger, Irwin Remson, and A. A. Fungaroli.
Water Resources Res, Vol 5, No 4, p 797-802, Aug 1969. 6 p, 5 fig, 1 tab, 7 ref.

Descriptors: *Groundwater movement, *Soil water movement, *Mathematical models, Model studies, Infiltration, Percolation, Water table, Darcy's law, Dupuit-Forchheimer theory.
Identifiers: Soil water-groundwater relations.

A model of transient moisture movement in a composite soil moisture-groundwater system is described. The model was used to study two-dimensional flow in response to a falling water table. The solution provided information about the interaction of the saturated and unsaturated portions of the subsurface system. The results of the composite model are compared with those obtained from three one-dimensional groundwater models. That soil moisture and nonlinearity do not have a significant effect on the position of the water table in the system studied is inferred. (Knapp-USGS)

INFLUENCE OF PINYON-JUNIPER CONVERSIONS AND WATER QUALITY ON PERMEABILITY OF SURFACE SOILS,
Utah State Univ., Logan; and Forest Service (USDA), Logan, Utah. Forestry Science Lab.
Gerald F. Gifford, and Ronald K. Tew.
Water Resources Res, Vol 5, No 4, p 895-899, Aug 1969. 5 p, 1 fig, 4 tab, 4 ref.

Descriptors: *Watershed management, *Rainfall-runoff relationships, *Clear-cutting, *Infiltration, *Permeability, Surface runoff, Arid lands, Water management (Applied), Pinyon pine trees, Juniper trees, Water quality, Percolation, Regression analysis, Evapotranspiration.
Identifiers: *Watershed clearing.

Chaining with windrowing treatment in the pinyon-juniper vegetation type significantly increased permeability of surface soils from the 0-2 and 2-4 inch depths at a site in southwestern Utah. Double chaining with debris in place did not yield a significant increase in permeability. Permeability of surface soils from a pinyon-juniper site in southeastern Utah provided a similar trend, though significant differences among treatments were not evident. Water quality influenced percolation only after approximately 30 minutes. Multiple regression equations developed for predicting intrinsic permeabilities varied according to water quality. STEADY GRAVITATIONAL CONVECTION INDUCED BY A LINE SOURCE OF SALT IN A SOIL,
Agricultural Research Service, Madison, Wis.
P. A. C. Raats.
Soil Sci Soc Amer Proc, Vol 33, No 4, p 483-487, July-Aug 1969. 5 p, 5 fig, 11 ref.

Descriptors: *Convection, *Diffusion, *Aqueous solutions, *Salts, Solutes, Saturated flow, Unsaturated flow, Soil water movement, Groundwater movement, Mass transfer, Ion transport, Hydraulic conductivity, Soil texture.
Identifiers: Salt solution convection.

A theoretical analysis of steady gravitational convection from a line source of salt in a saturated or in a uniformly partially saturated soil is presented. The flow pattern of the water-solute mixture and the distribution of the salt are shown to depend upon the source strength of the line source, the effective mass diffusion coefficient of the salt in the soil, the hydraulic conductivity of the soil, and a parameter describing the increase in density due to the added solute. Qualitatively, the analysis agrees with experimental observations. Theory and experiment both indicate that gravitational convection can be significant only if the hydraulic conductivity is large, which may be the case if the soil is coarse textured and the water content is not too small. (Knapp-USGS)

SOIL-WATER MOVEMENT IN RESPONSE TO IMPOSED TEMPERATURE GRADIENTS,
California Univ., Davis. Dept. of Water Science and Engineering.
D. K. Cassel, D. R. Nielsen, and J. W. Biggar.
Soil Sci Soc Amer Proc, Vol 33, No 4, p 493-500, July-Aug 1969. 8 p, 10 fig, 4 tab, 21 ref, 1 append.
Grant No DAAB G29-07-67-C00034.

Descriptors: *Soil water movement, *Convection, *Water temperature, *Thermodynamic behavior, *Diffusion, Mass transfer, Diffusivity, Water vapor, Thermodynamics, Unsaturated flow.
Identifiers: Temperature gradient, Ficks law.

Redistribution of soil water within insulated, uniformly packed, horizontal samples of unsaturated Columbia fine sandy loam at several soil-water contents was studied in response to imposed temperature gradients ranging from 0.5 to 1.0C/cm. Soil bulk density and initial, transient, and final soil-water-content distributions were determined each 0.5-cm along the column by gamma-radiation attenuation. Initial, transient and final soil temperature distributions were monitored by glass-encased thermistors at 2-cm intervals-both at the center and 0.3 cm from the column wall. Apparent thermal and isothermal soil-water diffusivity values were calculated using transient water content data. The observed net water flux was found to increase with decreasing water content. For Columbia soil the observed mean net water flux across 1-cm sections of the soil showed acceptable agreement with that predicted by the theory of Philip and deVries; Fick's law and the modified Taylor-Cary irreversible thermodynamic equation both underpredicted the observed fluxes. WATER MOVEMENT AND FREEZING PRESSURES,
Army Terrestrial Sciences Center, Hanover, N.H. Earth Sciences Branch.
Pieter Hoekstra.
Soil Sci Soc Amer Proc, Vol 33, No 4, p 512-518, July-Aug 1969. 7 p, 12 fig, 1 tab, 14 ref.

Descriptors: *Soil water movement, *Saturated flow, *Freezing, *Frost action, Frost, Ice, Thermodynamic behavior, Laboratory tests, Thawing, Mass transfer.
Identifiers: Ice lenses (Soil), Soil freezing.

Pressures develop when cylindrical column saturated soils are frozen unidirectionally u conditions of constant volume with an open w supply at the warm side. The value and behavi these pressures depend on soil type. If water m tion can take place in the frozen soil and ice le grow behind the freezing front the value of pressure depends on the temperature at the lens. This process occurs in clayey soils, and pressure is theoretically limited by the phase tr tion ice - water. Values of 100 atm have been sured experimentally. In soils where water m tion in the frozen soil does not occur and ice le form at the freezing front, the pressure reach constant value, which may vary between 0.2 for a sand soil and 3 atm for a silt soil. T modynamic models proposed to explain t phenomena are discussed. (Knapp-USGS)

ON THE INTERACTION OF WA MOLECULES AND MONTMORILLONITE S FACES,
Adelaide Univ. (Australia). Dept. of Agricul Biochemistry and Soil Science.
J. W. Kijne.
Soil Sci Soc Amer Proc, Vol 33, No 4, p 539- July-Aug 1969. 5 p, 2 fig, 2 tab, 31 ref.

Descriptors: *Water chemistry, *Adsorp *Clays, *Montmorillonite, *Ion exchange, V pressure, Thermodynamics, Thermodyn behavior, Hydration, Entropy.
Identifiers: Heats of wetting.

The adsorption of water was studied on mono montmorillonite saturated with Cs, Rb, Li, Na monium, and Ca ions. These ions vary in the fluence on the structure of water in solution. the effect on the adsorbed water by exchange could be compared with the effect of these io solution. Heats of wetting of the montmorill samples were determined as a function of equilibrium relative vapor pressure. Entropy v were calculated from the heats of wetting bined with values of the surface potential fro sorption isotherms using the Gibbs surface e equation. The decrease in heats of wetting wi creasing relative vapor pressure was discontin near a relative pressure of 0.1. This was interp as indicating a change at the surface of the mineral probably related to ion hydration ef Consequently the obtained entropy changes c not be assigned entirely to the adsorbed w molecules. At low relative vapor pressures th tropy values strongly reflected the influence o exchange ion which was found to be similar to exerted by these ions in solution. At higher rel vapor pressures the entropy of the system about 4 e.u. below that of liquid water which nearly the same as the likely value for the si sheet itself obtained in earlier studies. dentifiers: Gley soils, Histic pergelic cryaquepts.

Physical, chemical, and mineralogical properties are presented for 5 soils with permafrost in interior Alaska. The soils are shallowly thawed, with permafrost usually at 60 cm or less, and with a thick accumulation of organic matter, usually about 25 cm deep, over a gleyed mineral soil. They are classified as Histic Pergelic Cryaquepts in the comprehensive soil classification system adopted by the US Department of Agriculture. Histic Pergelic Cryaquepts are the most extensive soils developed over permafrost in Alaska. In three of the 5 profiles, particle-size analyses reveal a slight increase (2-4%) in clay content of the thawed mineral soil over that of the permafrost. The coarsest horizon in all 5 profiles contains only 48% sand. The dominant texture is silt loam. In one of the profiles, base saturation increases (52%-90%) with depth in the thawed mineral soil, then remains fairly constant in the permafrost. Percent Zr (0.02%) remains constant in the coarse silt fraction of all horizons of all 5 profiles both above and in the permafrost. The dominant clay minerals in the thawed horizons were vermiculite and kaolinite. (Knapp-USGS)

PHYSICAL PROPERTIES OF PEATS AS RELATED TO DEGREE OF DECOMPOSITION,
Forest Service (USDA), Grand Rapids, Minn. Northern Conifers Lab.
D. H. Boelter.
Soil Sci Soc Amer Proc, Vol 33, No 4, p 606-609, July-Aug 1969. 4 p, 4 fig, 3 tab, 6 ref.

Descriptors: *Soil physical properties, *Peat, Soil structure, Soil classifications, Organic matter, Hydraulic conductivity, Permeability, Water yield, Decomposing organic matter.
Identifiers: Peat fiber content.

Important physical characteristics, such as water retention, water yield coefficient, and hydraulic conductivity, vary greatly for representative northern Minnesota peat materials. The differences are related to the degree of decomposition, which largely determines the porosity and pore size distribution. Fiber content and bulk density are properties often measured to indicate the degree of decomposition of peat materials and are criteria used to distinguish fibric, hemic, and sapric peat types. Regression analysis showed a curvilinear relationship of water contents at saturation, 5 mbar, 0.1 bar, and 15 bar suctions, to fiber content and bulk density with coefficients of multiple determination ranging from .66 to 0.88. Regression analysis of the logarithm of hydraulic conductivity on fiber content and bulk density indicate a linear relationship although not as strong, due to the variability of hydraulic conductivity. It is concluded that the classification of peat materials and organic soils based primarily on degree of decomposition as measured by fiber content and bulk density relates significant information about their physical characteristics. REPLACEMENT OF WATER BY AIR IN SOIL PORES,
National Research Council of Canada, Ottawa (Ontario).
P. J. Williams.
Norw Geotech Inst, Publ Nr 72, p 75-90, 1968. 16 p, 12 fig, 12 ref.

Descriptors: Soil engineering, *Soil mechanics, Soil moisture, Soils, Soil properties, Soil tests, *Soil water, *Soil water movement, Moisture content, Capillary action, Capillarity, Capillary water, Pore pressure, Pores, Pore water pressures, Negative poor pressure, Diffusion, *Airwater interfaces.
Identifiers: Soil pore structure, Soil moisture storage, Soil suction, Soil-water interface, Soil-water interaction, Pore structure.

Soils composed of minerals having the same refractive index as water are translucent when saturated. Any air in the pores is fully visible. Such soils have been used to observe how air may replace water in soil pores. Three distinct processes that may occur in a soil when a difference in pressure P is established between the air and water are: (1) A process explained by capillary theory. If this process alone occurs, it gives a curve of moisture content versus P in which there is a conspicuous air-intrusion value of P, corresponding to an interface radius r sub c equal to that of the largest continuous openings through the soil. (2) A process that occurs more slowly, involving diffusion of air (from air external to the sample) to entrapped air bubbles, with a resulting enlargement of these. (3) A process of slow advance of interfaces into the soil, possibly due to a change with time, of interfacial energy, contact angle, or interface radius, or to a process not explained by the capillary theory. Advancement occurs under constant P. Additional drainage may occur because of consolidation caused by stresses on the soil skeleton, arising from the air-water pressure difference. This drainage may occur suddenly with the development of cracks in the soil. (USBR)

FACTORS INFLUENCING SOIL-MOISTURE RELATIONSHIPS IN UNDRAINED FORESTED BOGS,
Forest Service (USDA), Grand Rapids, Minn. North Central Forest Experiment Station.
Roger R. Bay.
Proceedings, International Symposium on Forest Hydrology, Pergamon Press, oxford, England, p 335-343, 1967. 9 p, 2 tab, 4 fig, 25 ref.

Descriptors: *Bogs, *Swamps, *Soil moisture, *Organic soils, Forest soils, Saturated soils, Water table, Groundwater, Hydrology, Soil physical properties, Peat, Minnesota.
Identifiers: *Peatlands, *Bog hydrology, Peat bogs, Groundwater bogs.

Saturated bogs or peatlands are found in all parts of the world, yet they receive little attention from hydrologists. Studies in northern Minnesota, U.S.A., have shown that a number of factors influence soil-moisture relationships and water storage characteristics in forested bogs. Various peat types were found to have significantly different physical properties which, in turn, directly affect water retention and water movement rates in bogs. Hydrogeologic conditions, particularly the influence of the regional groundwater system or the lack of such influence, directly affect bog water table fluctuations. Other factors such as hydrometeorologic events, vegetation characteristics, and evapotranspiration losses influence the soil-moisture regime. In the study bogs, soil moisture conditions were directly related to, and often described by, the position of the water table in the organic soil profile. The height of the bog water table, in turn, influenced storage capacity and runoff from the entire bog watershed.

HYDROLOGIC CHARACTERISTICS OF ORGANIC SOILS IN LAKE STATES WATERSHEDS,
Forest Service (USDA), Grand Rapids, Minn. North Central Forest Experiment Station.
Don H. Boelter.
J Soil and Water Conserv, 1966, 21 (2): 49-53. 5 p, 4 fig, 2 tab, 14 ref.

Descriptors: *Hydrologic properties, *Organic soils, *Peat, *Bogs, Watersheds (Basins), Bogs, Saturated soils, Water table fluctuations, Soil physical properties, Water storage, Hydraulic conductivity, Bulk density, Water contents, Storage capacity, Porosity, Minnesota.
Identifiers: *Bog hydrology, Peatlands, Peat types, Degree of decomposition, Pore size distribution, Wetland hydrology.

The physical properties of peats determine to a large degree the role of a given bog in the local and regional water regime. Studies have shown that most bogs are not the good water storage reservoirs they are often thought to be. Certain types of undecomposed moss peats appear to have a large capacity for water storage but actually provide little storage because their large pores release the water so quickly. Decomposed and herbaceous peats, on the other hand, provide little storage capacity because little water is removed from their small pores when the water table is lowered. This paper summarizes some of the hydrologic characteristics of several peat types studied over the past few years and relates these to land productivity and watershed values. Land managers must learn to recognize differences in peat types and understand their role in watershed management to properly manage over 15 million acres of peatlands in the northern Lake States.
W69-09573

HYDRAULIC CONDUCTIVITY OF PEATS,
Forest Service (USDA)Rapids, Minn. North Central Forest Experiment Station.
D. H. Boelter.
Soil Sci, 1965, 100 (4): 227-231. 5 p, 2 tab, 14 ref.

Descriptors: *Hydraulic conductivity, *Peats, *Water movement, *Saturated flow, Soil physical properties, Bulk density, Porosity, Water storage, Organic soils, Bogs, Hydrologic properties, Specific yield, Minnesota.
Identifiers: *Peat types, Pore size distribution, Horizontal hydraulic conductivity, Vertical hydraulic conductivities.

The rate of water movement through and out of a bog area will depend largely on the peat material found in the organic soil profile. In most lake-filled bogs water flows through moss peat horizons near the surface and little flows through dense herbaceous peats at lower horizons. In other types of bogs with different peat profiles, more flow may occur at greater depths. Hydraulic conductivities (or water movement rates) of peat types were found to cover a wide range of values. The values were related to specific yield and to pore-size distribution. Field-measured hydraulic conductivities of peats were significantly lower than corresponding laboratory values, and these field values were accepted as more accurately representing water movement rates of organic soils. Further analysis indicated no significant difference between vertical and horizontal hydraulic conductivity as measured by the tube and piezometer methods.
W69-09574

IMPORTANCE OF VOLUMETRIC EXPRESSION OF WATER CONTENTS OF ORGANIC SOILS,
Forest Service (USDA), Grand Rapids, Minn. North Central Forest Experiment Station.
D. H. Boelter, and G. R. Blake.
Soil Sci Soc Amer Proc, 1964, 28 (2): 176-178. 3 p, 3 fig, 1 tab, 5 ref.

Descriptors: *Water content, *Bulk density, *Peat, *Organic soils, Soil physical properties, Bogs, Swamps, Soil water, Hydrologic properties, Soil physics, Soil analysis, Saturated soils, Water storage, Minnesota.
Identifiers: *Volumetric water contents, Peatlands, Bog hydrology.

Methods for evaluating water contents and bulk densities of several different peats are compared, Because bulk densities (saturated volume basis) of moss, herbaceous, and aggregated peats varied from 0.028 to 0.249 g. per cc., a highly distorted impression of the amount of water actually held under field conditions is given if water values are expressed on an oven-dry weight basis. On a wet-volume basis, moss peat held only 10 to 20% more water at saturation than did herbaceous and aggregated peat and retained less water than they did at higher suctions. Between 0.1 and 15 bars, moss peat retained about one-quarter the volume of water of a medium-textured mineral soil, Barnes loam. Since considerable volume reduction occurs on drying, bulk density of oven-dry peat, Db (dry volume basis), represents an artificial condition rarely, if ever, occurring in undrained bogs. Bulk densities must, therefore, be calculated on the basis of the wet bulk volume and are referred to as Db (wet bulk volume). A more precise expression of degree of wetness may be substituted for 'wet' in the wet volume basis term.
W69-09575

WATER STORAGE CHARACTERISTICS OF SEVERAL PEATS IN SITU,
Forest Service (USDA), Grand Rapids, Minn. North Central Forest Experiment Station.
D. H. Boelter.
Soil Sci Soc Amer Proc, 1964, 28 (3): 433-435. 3 p, 3 fig, 2 tab, 5 ref.

Descriptors: *Water storage, *Peats, *Organic soils, *Porosity, *Storage coefficient, Soil physical properties, Bogs, Swamps, Bulk density, Soil water, Hydrologic properties, Available moisture, Moisture tension, Water level fluctuations, Minnesota.
Identifiers: *Water storage capacity, *Pore size distribution, *Peat type, Available water, Water suction.

Water storage characteristics of the various horizons in a northern Minnesota bog were found to vary considerably with peat type. Surface horizons of sphagnum moss peat contain 0.020 g. per cc. of dry material and 95 to nearly 100% water by volume at saturation. Its total porosity consisted primarily of large pores which released 0.80 cc. of water per cc. between saturation and 0.1 bar suction. Decomposed and herbaceous peats from horizons below 25 cm. had water-holding properties strikingly different from those of the moss peats. These materials had bulk densities of 0.24 and 0.14 g. per cc., respectively, and they contained between 80 and 90% water by volume at saturation. Their porosity, though high, consisted primarily of many small pores which are not easily drained at low suctions. They retained 65 to 75% water by volume at 0.1-bar suction. These data show that a specific change in water table elevation in the horizons containing loose, porous, undecomposed moss peat would involve a great deal more water than the same change in horizons of more dense decomposed and herbaceous peats. Thus, the hydrologic role of any bog or bog area in a watershed will depend on the type of peat found in the organic soil profile.

SCILLAXANTHIN IN THE SEDIMENT OF AKE WASHINGTON,
ashington Univ., Seattle, Dept. of Zoology.
ary Griffiths, Pamela S. Perrott, and W. T. dmondson.
mnol and Oceanogr, Vol 14, No 3, p 317-326, ay 1969. 10 p, 1 fig, 2 tab, 22 ref. Grant GB-51X (NSF).

escriptors: *Lakes, *Sediments, Pigments, Washington, Organic matter, Plankton, Sewage, roductivity, Chemical analysis, Algae, Spec-oscopy, Sedimentation rates, Erosion.
entifiers: Lake Washington sediment.

scillaxanthin in Lake Washington sediment was etermined quantitatively from cores cut in slices 1 n thick. The pigment content varies with depth nsistently in all cores; however, the amount of gment per unit dry weight of sediment is highest the surface and has two subsurface maxima at 4 n depth and 7 to 9 cm depth. The total accumu-ted pigment under unit area of bottom mud varies om 27.10 to 6.66 microgram/sq cm. The oscillax-nthin-producing algae evidently were somewhat fferently distributed during sedimentation, for e differences are not related to differences in dis-ibution of the plankton. The study indicates that the first appearance of oscillaxanthin probably came early in the period of sewage enrichment that led to the recent diversion of sewage from Lake Washington. (Gabriel-USGS)

Descriptors: *Algae, *Photosynthesis, *Lakes, *Population, *Minnesota, Productivity, Oxygen, Analytical techniques, Light intensity, Water chemistry, Water temperature, Plankton, Phytoplankton, Nutrients.
Identifiers: Lake Itasca (Minn).

Both absolute and relative values of net photosynthesis were measured directly in a field experiment conducted on August 7, 1967 using an almost monospecific natural population of the blue-green alga Oscillatoria agardhii. Relatively short (2-hr) incubation periods were utilized so that diurnal curves could be established. The net rate of oxygen production varies with light intensity reaching light saturation at near 10% of the maximum insolation. High rates of production occur during twilight at the surface, and the highest production is at 30% of noon intensity. Light quality, as well as intensity, is important, and filtering effect of lake water enhances subsurface oxygen production even at relatively high light intensities. (Gabriel-USGS)

SEASONAL FLUCTUATIONS OF LAKE MICHIGAN DIATOMS,
Bureau of Commercial Fisheries, Ann Arbor, Mich.
Ruth E. Holland.
Limnol and Oceanogr, Vol 14, No 3, p 423-436, May 1969. 14 p, 7 fig, 3 tab, 32 ref.

Descriptors: *Diatoms, *Lake Michigan, *Seasonal, Sampling, Plant populations, Biomass, Analytical techniques, Chemical analysis, Water analysis, Nitrates, Phosphates, Chlorophyll.
Identifiers: Lake Michigan diatoms.

Water samples containing diatoms were collected at 4 areas of Lake Michigan and Green Bay from April to November 1965. The flora of the lake is characterized by 7 diatom species and the Green Bay water is characterized by 6 species, with Stephanodiscus niagarae dominating the biomass of the Bay. There was an average of 517 diatoms per ml in the lake and 944 per ml in Green Bay. Diatom abundance appeared to have 1 peak in the lake and 2 peaks in the bay. The higher population near the eastern shore of the lake and in Green Bay appeared to be correlated with higher concentrations of phosphorous and chlorophyll and lower concentrations of nitrate. PHYSICOCHEMICAL LIMNOLOGY AND RELATED FISH DISTRIBUTION OF KEYSTONE RESERVOIR,
Oklahoma State Univ., Stillwater. Aquatic Biology Lab.
Rex L. Eley, Neil E. Carter, and Troy C. Dorris.
Reservoir Fish Resources Symp, Georgia Univ. Apr 5-7, 1967, p 333-357, 1967. 25 p, 21 fig, 8 tab, 20 ref.

Descriptors: *Limnology, *Reservoirs, *Fisheries, *Water quality, *Thermal stratification, Chemical stratification, Density stratification, Hypolimnion, Dissolved oxygen, Water temperature, Conductivity, Alkalinity, Decomposing organic matter, Anaerobic conditions, Carbon dioxide, Turbidity, Light penetration.
Identifiers: *Keystone Reservoir (Ark), *Physicochemical limnology, Vertical fish distribution.

Water temperature, conductivity, pH, alkalinity, carbon dioxide, specific gravity, oxygen, turbidity, and light penetration were determined for each meter of depth at 4 stations along the Cimmaron arm of Keystone Reservoir from September 1965 through August 1966. Occasional measurements were also made at several points on the Arkansas arm and below Keystone Dam. The vertical fish distribution was also determined. Chemical and thermal stratifications due to density differences between Arkansas and Cimarron River waters were present in Keystone Reservoir during all seasons. Relatively high concentrations of carbon dioxide, hydrogen sulfide, and ammonia accumulated in the hypolimnion as a result of organic matter decomposition under anaerobic conditions. However, water quality in the hypolimnion improved as a result of oxygenation during discharge. It was concluded the vertical distribution of fish was highly temperature dependent. Also, oxygen values lower than 2 mg/l was a limiting factor for the fish distribution in Keystone reservoir. (Carstea-USGS)

THE ENVIRONMENT AND PLANKTON DENSITY IN MISSOURI RIVER RESERVOIRS,
Bureau of Sport Fisheries and Wildlife, Yankton, S. Dak.
N. G. Benson, and B. C. Cowell.
Reservoir Fish Resources Symp, Georgia Univ, Apr 5-7, 1967, p 358-373, 1967. 6 p, 6 fig, 3 tab, 19 ref.

Descriptors: *Reservoirs, *Productivity, *Plankton, *Water quality, *Missouri River, Zooplankton, Phytoplankton, Density currents, Turbidity, Water temperature, Ions, Diatoms, Chemical stratification, Copepods.
Identifiers: *Missouri River reservoirs, Plankton density.

Morphometry, water chemistry, temperature, currents, turbidity, and phytoplankton were studied in the 6 main reservoirs on the Missouri River, which have a total area of 463,000 ha. Each reservoir is covered yearly by ice from 85 to 123 days. Heavy winds and currents prevent stratification in the upper 12 m of water of the large reservoirs. Generally, density currents are not common in the reservoirs. Turbidity is caused by fine sand, silt and clay particles. Calcium, magnesium, bicarbonates, and sulfates occur in relatively high concentrations. Chemical stratification was found in Garrison Reservoir. Diatoms dominate the flora; the maximum densities of phytoplankton occurred in spring and early summer, as well as in late summer and fall. Among zooplankton, Cladocera and Copepoda showed little vertical or horizontal stratification in Lewis and Clark Lake. Protected areas in Oahe Reservoir have higher zooplankton densities than unprotected areas. Turbidity is the strongest limiting factor for plankton development in the reservoirs. The dynamics of the plankton in a reservoir can be understood only in the amounts of inflowing, indigenous and discharging plankton are known. (Carstea-USGS)

PHYSICOCHEMICAL LIMNOLOGY OF FOUR RESERVOIRS IN SOUTHWEST NEBRASKA,
Bureau of Sport Fisheries and Wildlife, Billings, Mont.; and Nebraska Game, Forestation, and Parks Commission, Lincoln.
Donald L. Tennant, Robert E. Thomas, and Joe Gray.
Reservoir Fish Resources Symp, Georgia Univ, Apr 5-7, p 537-540, 1967. 4 p.

Descriptors: *Limnology, *Reservoir fisheries, *Thermocline, *Nebraska, *Water quality, Water temperature, Dissolved oxygen, Reservoirs, Stratification, Outlets, Physical properties, Chemical properties.
Identifiers: *Reservoir limnology, Nebraska reservoirs.

Physicochemical data from 4 reservoirs in Nebraska taken within a 30-hr period in August, revealed moderate thermal stratification, closely associated in 2 reservoirs with the functioning low-level outlet. The reservoirs with thermoclines exhibited greater temperature ranges and contained cooler waters than did reservoirs without thermoclines. The distribution of fish as detected on sonar often revealed the presence and location of a thermocline prior to physical or chemical data verification. Without exception, the larger the reservoir and the lower the outlet, the better the reservoir fishery. Downstream fisheries ranked the same with one exception. (Carstea-USGS)

THE PRESENT STATE OF LAKE ZURICH (IN GERMAN),
Kantonales Laboratorium, Zurich (Switzerland). Limnologische Abteilung.
E. A. Thomas, and E. Marki.
Proc of the International Association of Theoretical and Applied Limnology, Vol 10, p 476-488, 1949. 9 fig.

Descriptors: *Eutrophication, *Lakes, Limnology, Hydrogen ion concentration, Cycling nutrients, Phytoplankton, Temperature, Nitrates, Ammonia, Phosphorus, Manganese, Chlorides, Sulfates.
Identifiers: Lake Zurich (Switzerland), Switzerland, Oscillatoria rubescens, Oxidation capacity, Solid matter.

The first part of the paper by Thomas reports, largely in graphic form, monthly or occasional changes in nutrient content (nitrate, ammonia, phosphorus, manganese) temperature, and density of plankton, particularly that of Oscillatoria rubescens, in Lake Zurich. Observations cover a period from October 1943 to December 1947, and from surface to 140 meter depths. The second part of the report, by Marki, gives account of changes that took place during the same period in the contents of oxygen, calcium carbonate, carbon dioxide, pH value, chloride and sulphate ions, oxidation capacity, and solid matter on air-dry and oven-dry basis. THE IONIC COMPOSITION OF LAKE WATERS,
Uppsala Univ. (Sweden). Inst. of Limnology.
Wilhelm Rodhe.
Proc of the International Association of Theoretical and Applied Limnology, Vol 10, p 377-386, 1949. 21 fig, 2 tab, 4 ref.

Descriptors: *Ions, *Lakes, *Water chemistry, Limnology, Electrolytes, Statistics, Water analysis, Colloids, Geochemistry, Conductivity.
Identifiers: Seawater minerals, Freshwater minerals, Bicarbonate water types, Standard water composition, Conductivity of lake waters.

The author subjected to statistical treatment 5,300 analytical values on Swedish lakes, given in the voluminous monograph of G Lohammar's 'Wasserchemie und Hohere Vegetation Schwedischer Seen' (1938). Examination of recalculated data revealed a surprisingly close coincidence of the average composition of Swedish lakes with that of freshwaters (lakes and rivers) of the world, as given by F W Clarke in his 'Data of Geochemistry' (1911). The author attributes this coincidence to ionic exchanges between free ions and the colloidal systems of soils and lake muds. He concludes that there is no need for a complete water analysis of bicarbonate lakes having the same content of electrolytes, as expressed by the conductivity of the water and the concentration of the major constituents (calcium, magnesium, sodium, potassium, chloride, sulfate, and bicarbonate ions). SEDIMENTATION IN ARTIFICIAL LAKES,
Soil Conservation Service, Washington, D.C.
Stafford C. Happ.
A Symposium on Hydrobiology, p 35-44, 1941. Wisconsin Univ Press, Madison. 2 tab.

Descriptors: *Lakes, *Sedimentation, Floods, Erosion, Chaparral, Grazing, California.
Identifiers: Deforestation, Erosion intensity, Lake capacity, Los Angeles (Calif).

Detailed surveys by the U S Soil Conservation Service and other agencies, of 148 artificial lakes showed the following average annual loss of the water-retaining volume of artificial lakes due to sedimentation of erosion products: 34 lakes, less than 0.5%; 39 lakes, 0.5 to 1%; 39 lakes, 1 to 2%; 36 lakes, over 2%. The latter figure includes 11 lakes in the Los Angeles, California, area surveyed after the catastrophic flood of 1938. For an appraisal of the erosion intensity, accumulation of sediment per unit of drainage area (in cubic feet per acre) is more significant than the reduction in the capacity of lakes. Cultivation of soils, overgrazing, deforestation, and burning off the chaparral or brush are the major causes of excessive sedimentation. (Wilde-Wis)

INCREASE IN THE CONTENT OF ORTHO-PHOSPHORUS AS AN EXPRESSION OF PROGRESSIVE EUTROPHICATION OF LAKE CONSTANCE (GERMAN),
Institut fur Seenforschung und Seenbewirtschaftung Langenargen am Bodensee.
Richard Kliffmuller.
Int Revue ges Hydrobiologie, Vol 47, No 1, p 118-122, 1962. 1 fig, 1 tab, 12 ref.

Descriptors: *Phosphorus compounds, *Eutrophication, Oligotrophy, Lakes, Water analysis, Limnology, Nutrients, Cycling nutrients, Turnovers, Thermal stratification.
Identifiers: *Lake Constance (Switzerland), Switzerland, Germany.

The change which Lake Constance has undergone from the oligotrophic state to a moderately eutrophic condition is expressed by a rather sharp curve for the water content of ortho-phosphorus. In 1958-1959, the curve attained its peak at approximately 9 milligrams/cubic meter of ortho-phosphorus. The author stresses the importance of confining water analyses to the end of turnover, i.e., months of March or April, depending on weather conditions of the year. (Wilde-Wis)

CHEMICAL INVESTIGATION OF LAKE SED MENTS AND THEIR INTERPRETATION,
Freshwater Biological Association, Windermere (England).
F. J. H. Mackereth.
Proc Royal Society, B, Vol 161, p 295-309, 196 14 fig, 4 ref.

Descriptors: *Chemical properties, *Lakes, *Sed ments, Carbon cycle, Clay, Erosion, Climat Leaching, Deforestation, Halogens, Peat, Pollen Connecticut, Chlorine.
Identifiers: English Lake District, Linsley Po (Conn), Chemical stratigraphy, Elemental ratio Bromine, Altitudinal effects.

The content of organic carbon is considered as t most important variable of lake sediments. T composition of sediments is attributed to geologic features and the history of watersheds, rather th the composition of lake basins. To some exte sediments reflect the stability of land surfaces. T sediment content of potassium and sodium ma serve as a gauge of the intensity of post-glacial er sion. The presence of calcium suggests incidence severe denudations. The sequence of changes lake sediments is influenced by variation in climat conditions, impoverishment of soils by leachi and deforestation. Climatic conditions of the pa were appraised on the basis of the content halogens (chlorine, bromine) transported from th ocean and indicating oceanity of climate. (Wild Wis)

CONTROL OF SEDIMENTATION AND BO TOM CONFIGURATION BY CONVECTIO CURRENTS, LAKE WASHINGTON, WASHIN TON,
Humble Oil and Refining Co., Houston, Tex.; a Coast Guard, Woods Hole, Mass.
Howard R. Gould, and Thomas F. Budinger.
Journal of Marine Research, Vol 17, p 183-19 1958. 6 fig, 10 ref.

Descriptors: *Sedimentation, *Convection, *Cu rents (Water), Glacial drift, Glaciation, Mud, Ter perature, Circulation, Radioactive dating, Sed ments, Washington, Clay, Lakes, Limnology.
Identifiers: *Bottom configuration, *La Washington (Wash), Seattle (Wash), Lake topo raphy, Physical limnology.

Lake Washington, in Seattle's environs, occupies deep, narrow W-shaped trough in cross sectio sculptured by the last continental glacier. The sed ments consist of blue clay of meltwater origi more than 100 feet thick, overlain by limnic gytt 5 to 55 feet thick. Core profiles across the la show that the trough was U-shaped at the close the blue-clay deposition and that the W-shape profile had its present configuration for approx mately 6,700 years. Sedimentation rates differe appreciably even over short distances over the la bottom. Investigations of lake temperature profile together with model experiments to simulate cond tions of convective flow, point to convection cu rents as responsible for the observed variations sedimentation of gyttja which, in turn, account f the unusual W-shaped configuration of the troug floor. (Bortleson-Wis)

f, Particle size, Shallow water, Particle shape,
mentation rates, Sedimentology, Geochemis-
Sedimentary structures.
tifiers: Atlantic Continental Shelf.

r 1,000 sediment samples from the Atlantic
inental shelf off the southern United States
investigated to determine the usefulness of
carbonate fraction in studying shelf history in a so-called 'noncarbonate' area. Particle characteristics of the carbonate fraction are emphasized. These include particle rounding and the proportions of fragmental, blackened, and of worn versus fresh components. The abundance of carbonates is mainly a function of the amount of dilution by terrigenous materials from Piedmont rivers. Calcium carbonate is least abundant on the Georgia shelf and increases greatly to the south and slightly to the north. The abundant of black shells, oolites, and shallow water fauna over large portions of the shelf shows a shallow-water origin of much of the shelf surficial material. The abundance of worn and broken shells reflects the low rate of sedimentation. Much of the present shelf sediment cover was originally deposited in the nearshore zone of the last transgressing sea, not the beach environment, as indicated by particle roundness. The areal distribution of certain carbonate fraction parameters can be interpreted as linear patterns paralleling the present shorelines. These may reflect ancient shorelines. (Knapp-USGS)

SUMMARY OF RESERVOIR SEDIMENT DEPOSITION SURVEYS MADE IN THE UNITED STATES THROUGH 1965.
Agricultural Research Service, Oxford, Miss. Sedimentation Lab.

US Department of Agriculture, Misc Publication No 1143, May 1969. 64 p. Dendy, F. E., and Champion, W. A., Compilers.

Descriptors: *Reservoir silting, *Sedimentation, *On-site data collections, *United States, Documentation, Surveys, Watersheds (Basins), Sediment yield, Drainage systems, Inter-Agency Comm on Water Resources, Publications.
Identifiers: *Water Resources Council, Data sources.

Data from reliable reservoir sedimentation surveys made in the United States through 1965, and from surveys made after 1965 for a few reservoirs, are presented in a summary table. All of the 48 conterminous States, except Maine and Florida, and Puerto Rico, are included. An index of river basin maps and a sample form for reporting the data are given. This publication supersedes and updates USDA Miscellaneous Publication 964, published in May 1964. All surveys reported in that bulletin have been repeated here. Reservoirs are grouped according to the 79 drainage areas as divided by the Subcommittee on Hydrology, Federal Inter-Agency River Basin Committee, now under jurisdiction of the Water Resources Council. Surveys range from reconnaissance measurements of sediment depth at a few locations to detailed surveys based on closely spaced cross sections or contours. Total drainage area includes the reservoir and area lying above all upstream dams but generally excludes noncontributing areas within the basin boundary. Where available, USGS drainage area figures are used. (Lang-USGS)

SEDIMENT BUDGET ALONG A BARRIER ISLAND CHAIN,
Smithsonian Institution, Washington, D.C.; and George Washington Univ., Washington, D.C.
J. W. Pierce.
Sediment Geol, Vol 3, No 1, p 5-16, Mar 1969. 12 p, 4 fig, 1 tab, 23 ref. Grant No G-16362 (NSF).

Descriptors: *Sedimentation, *Sedimentation rates, *Islands, *Barriers, *Provenance, Coasts, Mapping, Erosion, Biomass, Tertiary period, Dunes, Wind erosion, Topography, Sands, Saltation, Petrography, Continental shelf, Currents (Water), Waves (Water).
Identifiers: North Carolina coastal sedimentation.

Physiographic changes along a coast are used to define the sediment budget of a stretch of the coast, if reliable historical records are available. This physiographic method was applied to the study of the North Carolina coast located between Cape Hatteras and Cape Lookout. The accretion of sediment has occurred at the average annual rate of 796,000 cubic meters with the material supplied by longshore drift, transportation from the mainland, and the continental shelf acting as a reservoir of the sediment that is presently accreting in the nearshore area. RESTORATION OF GULLIED VALLEY FLOORS IN ARID AND SEMIARID REGIONS,
Geological Survey, Washington, D.C.
Norman J. King.
Proc 23rd Int Geol Congr, Vol 12, p 187-195, 1968. 9 p, 2 fig, 16 ref.

Descriptors: *Accelerated erosion, *Gully erosion, *Erosion control, Land management, Runoff, Aggradation, Check structures, Diversion structures, Slope protection, Soil conservation, Vegetation establishment.
Identifiers: Eroded land restoration, Semiarid regions.

The causes and effects of accelerated soil erosion in overgrazed grassed valleys are discussed and methods of restoring gullied land are outlined. Runoff and erosion are increased by soil compaction and by removal of plant cover. Studies of ephemeral stream channels show that natural processes of gully widening and meandering tend to result ultimately in aggradation. Aggradation can also be increased by artificial obstructions placed in channels or by decreasing discharge. Not all gullied valleys are equally amenable to treatment. The areas where some aggradation is already taking place respond best. Narrow rapidly eroding gullies should be allowed to widen before starting treatment. Runoff control should be applied evenly over an eroding basin so that aggradation is as uniform as possible. Runoff control measures should be applied mainly to noneroding parts of basins so that as much water as possible, and as little sediment as possible is withheld from the gully net. This increases aggradation in channels at the same time it retards reservoir silting in water control structures. (Knapp-USGS)
W69-09506

MEASUREMENT OF SAND TRANSPORT IN RIVERS WITH SPECIAL REFERENCE TO TRACER METHODS,
Hydraulics Research Station, Wallingford (England).
M. J. Crickmore.
Sedimentology, Vol 8, No 3, p 175-228, May 1967. 54 p, 28 fig, 1 plate, 6 tab, 30 ref, append.

Descriptors: *Sediment transport, *Bed load, *Rivers, *Tracers, Tracking techniques, Model studies, Hydraulic models, Estuaries, Sands, Silts, Radioactivity techniques, Dye releases, Statistical methods.
Identifiers: Bed load tracers.

Tests were made on a small river to examine the practicability of tracer measurements of sand transport in rippled beds in natural channels. The spatial integration, time integration, and steady dilution methods were examined by using radioactive and fluorescent tracers. The serious limitations of the time integration and steady dilution methods under conditions of unsteady solids discharge were exposed by a sudden flood discharge occurring during the course of the study. An approximate method

based on the time integration approach but also requiring some spatial tracer data yields an estimate of the transport in the case of highly variable sand discharge, but the spatial integration method offers the most workable and informative tracer method for use in natural rivers. The results were generally consistent with those given by the summation of the measured suspended solids flux and bed load, determined from the downstream advance of ripple bed-forms. Methods are described for bed load estimation from ultrasonic echo sounder records of bed profiles. Sand transport values are calculated for a number of river discharges and for 2 laboratory channel tests using various procedures by Einstein, Bagnold, Meyer-Peter and Muller, and Laursen. Significant differences in the computed values for individual flow conditions are observed. (Knapp-USGS)

SEDIMENTATION OF RESERVOIRS,
Central Soil Mechanics Research Station, New Delhi (India).
I. C. dos M. Pais-Cuddou, and N. C. Rawel.
ASCE Proc, J Irrig and Drainage Div, Vol 95, No IR3, Pap 6789, p 415-429, Sept 1969. 15 p, 8 tab.

Descriptors: *Reservoir silting, *Bed load, *Suspended load, Reservoir storage, Sediment load, Forecasting, Sedimentation, Sediment yield, Silts, Sands, Gravels.
Identifiers: *India, Reservoir sedimentation studies.

The methods of estimating reservoir sedimentation used in India are outlined. During the planning stage, the only method available for predicting the life of a reservoir or the sedimentation rate is to conduct sediment observations on the river. Accurate measurement of suspended sediment load, assumption of the required quantity of bed load, unit weight of sediment, and proportion of the grades of sediment likely to be deposited are some of the important items which need to be taken into consideration. After a reservoir has been built, the rate of sediment deposition can be determined either by measurement of inflow and outflow of sediment or by conducting actual capacity surveys of the reservoir by echo sounding instruments. The latter method is comparatively more accurate and the results obtained are well within 10% of the true value. Contrary to previous experience, it has been found that the percentage of fine-grade sediment trapped in the reservoir is considerably higher than the coarse and medium grade of sediment. Several factors control the location of sediment deposits in the reservoir. The reservoir operation schedule is one of the major factors as well as the shape and size of the reservoir, amount and characteristics of the sediment load, valley slope, and vegetation at the head of reservoir. It has been found that the sediment deposition is not only restricted to dead storage but that it also affects the live storage space. (Knapp-USGS)

SOIL EROSION CONTROL PRACTICES IN PERSPECTIVE,
Harza Engineering Co., Chicago, Ill.
Paul Jacobson.
J Soil and Water Conserv, Vol 24, No 4, p 123-126, Aug 1969. 4 p, 2 fig, 10 ref.

Descriptors: *Soil erosion, *Erosion control, *Check structures, *Farm management, Contour farming, Embankments, Land forming, Land management, Slope protection, Soil conservation, Strip cropping, Terracing, Water control.
Identifiers: *Tillage practices.

Many standard soil erosion control practices have proven impossible to sell to farmers, and some are no longer applicable to farming practices now in use. The standard practices are reviewed and suggestions are made for their modification or replacement in cases of lack of use or obsolescence. Contouring is not suitable for large-scale mechanized farming in humid areas. Crop rotation is no longer necessary to add nitrogen, and is not used by farmers who do not need grass crops. Strip cropping is seldom used in corn areas or by non-users of grass. Terracing is effective if constructed properly but more research on the relation of terrace shape to land and climate conditions is needed to utilize the system well. Tillage practices are used well in many cases, but more need to be established for various crop-weather-runoff situations. It is concluded that Corn Belt farmers will accept only no-flow till-plant minimum tillage programs with water control by storage fills across waterways. Use of this system can reduce downstream sediment and nutrient loads to very low levels. (Knapp-USGS)

SEDIMENT MOVEMENT IN AN AREA OF SUBURBAN HIGHWAY CONSTRUCTION, SCOTT RUN BASIN, FAIRFAX COUNTY, VIRGINIA, 1961-64,
Geological Survey, Washington, D.C.
R. B. Vice, H. P. Guy, and G. E. Ferguson.
Geol Surv Water-Supply Pap 1591-E, p E1-E41, 1969. 41 p, 13 fig, 11 tab, 10 ref.

Descriptors: *Sediment yield, *Urbanization, *Road construction, *Virginia, Highways, Runoff, Soil erosion, Sediment load, Sampling, Surveys, Excavation, Water pollution sources, Water pollution effects, Sedimentation.
Identifiers: Highway construction sediment yield, Fairfax County (Va).

Movement of sediment during a period of intensive highway construction was studied in the Scott Run basin, Fairfax County, Va., from 1961 to 1964. The 4.54 sq mi drainage basin, which empties into the Potomac River about 6 mi above the head of the Potomac Estuary, was the scene of highway construction covering 11% of the basin; other types of urban construction in the basin during this time were minor. Sediment was measured at the gaging station by a system of representative samples. These samples made it possible to document the sediment yield for 88 storm events representing overland runoff. The 88 events accounted for 3 of the runoff and 99% of the sediment movemer 3% of the time. The highway construction ar varying from less than 1 to more than 10% of basin at a given time, contributed 85% of the s ment; 38% of the sediment movement occu during April, May, and June, and only 11% curred during July, August, and September; an the basis of residual soil and stream-sediment p cle sizes, the amount of sediment eroded f areas of construction was about twice that tra ported from the basin. Sediment yield is about times that normally expected from cultivated la 200 times that expected from grassland, and 2, times that expected from forest land. (Kna USGS)

IMPORTANCE OF THE BOIS BRULE RIV TO RECENT SEDIMENTATION HISTORY WESTERN LAKE SUPERIOR,
Wisconsin State Univ., Superior.
A. B. Dickas, and P. C. Tychsen.
Wisc State Univ, Research Report, 1969. 2
OWRR Proj A-023-Wis.

Descriptors: *Sedimentation, Lake Super Wisconsin, Petrology, Suspended-load.
Identifiers: *Bois Brule River (Wis), *Sedimen analysis, Sedimentation history.

A sedimentary analysis was made of the bed suspended load of the Bois Brule River, Dou County, Wisconsin to better understand the stat cal characteristics of the clastic materials b transported by this stream and its contributio the Holocene sedimentation history of the Wisc sin shoreline of Lake Superior. In addition bedr and glacial deposits were mapped throughout drainage basin. The average mean size distribu of the clastic load, based on the phi scale, is as lows: 10% granules, 74% sand, 13% silt and clay. To determine whether this dominantly sa sized sediment was derived from basement roc glacial debris, stream gravels larger than gra size were petrographically analyzed and compa to surficial and basement rock maps. Results dicate that the glacial cover is the prime sourc the clastic material of the river load, concur with the mapping program which shows that wash sands and reworked glacial drift predomi over much of the drainage area. A second source is outcropping Keweenawan (Cambr sandstones. Earlier studies indicate the river loa deposited in Lake Superior out to a distance one-half to one mile from the shoreline with finer material found at the greater distance f the littoral zone.

escriptors: *Ion exchange, *Clays, *Montmoril-nite, Ion transport, Sodium, Calcium, Floccula-on, Colloids, Adsorption, Diffusion.
entifiers: *Tactoid formation.

he kinetics of Ca-montmorillonite tactoid forma-on and breakdown was followed by recording the anges in light transmission as a function of time hen Ca-montmorillonite suspensions of 0.05% /v) concentration were added to Na-montmoril-nite suspensions of the same concentration in a rating vessel placed in the light path of a ecrophotometer. Tactoid formation was found to instantaneous whereas the breakdown of Ca tac-ids took about 10 min. It was suggested that the itial step upon mixing sodium and calcium mont-orillonite was the redistribution of adsorbed ions. or tactoids to break, ions have to interdiffuse into e tactoids. Since the mobility of ions adsorbed on e internal surfaces is low, tactoid breakdown is ow. Ion diffusion on the single platelets of Na clay nd the external surfaces of the tactoids is high; us the formation of tactoids is instantaneous. (K-app-USGS)

escriptors: *Ion exchange, *Potassium, *Soils, Wetting, *Drying, Hysteresis, Nutrients, eaching, Ion transport, Soil moisture, Soil water ovement, Organic matter.
lentifiers: Potassium fixation.

he changes in exchangeable K that occur when oils are dried and rewet, and the affect of organic dditives on these changes were determined with 0 soils from the North Central Region of the USA. he release of K associated with drying was essen-ally eliminated by adding dextrose to the soils be-fore drying. The use of dried samples for the deter-mination of the exchangeable K in field-moist soils will be limited to some extent, however, because some soils fix K when the are dried and dextrose does not prevent fixation. In most cases, a decrease in exchangeable K occurred when air-dry soils were rewet. A greater decrease in exchangeable K was attained with all soils when the air-dry, rewet samples were redried in the presence of octanol. In some cases, only the reversion of K released by drying was involved, and the decrease was not enough to reduce the exchangeable K level to that in undried soil. In others, K fixation occurred and the heated soils contained less exchangeable K after treatment than they had in their field-moist state. Nevertheless, the octanol treatment resulted in improved estimates of plant-available K and of exchangeable K in undried soil samples over those obtainable with either air-dry or air-dry rewet samples. CHEMICAL AND BIOLOGICAL WEATHERING IN VERMICULITE FROM TRANSVAAL,
Yale Univ, New Haven, Conn. School of Forestry.
B. L. Sawhney, and G. K. Voigt.
Soil Sci Soc Amer Proc, Vol 33, No 4, p625-629, July-Aug 1969. 5 p, 5 fig, 16 ref.

Descriptors: *Weathering, *Soils, *Mineralogy, *Clays, Ion exchange, Salts, Solutes, Aqueous solutions, Expansive clays, Expansive soils, Leaching, Chemical reactions, Biodegradation.
Identifiers: *Vermiculites, Interlayer expansion, Electron microprobe analysis, Structure (Mineralogic).

Transvaal vermiculite flakes were weathered in solutions of salts or acids as well as in nutrient solutions inoculated with water extracts of soils from hemlock (Tsuga canadensis) and tulip poplar (Liridendron tulipifera) forest stands. Morphological changes were studied with a microscope and the structural changes were determined by X-ray diffraction analysis, while the changes in chemical composition were estimated by an electron microprobe. Weathering of flakes proceeded from edges inward and produced a weathered zone parallel to the flake edges. However, the changes produced by salt solutions were different from those by acids and biological agents. Treatment with salt solutions produced the expanded weathered zone with the 14A c-axis spacing as compared to 10A spacing of the unaltered zone. Electron microprobe analysis revealed that the salt treatment replaced the interlayer K ions by the hydrated cations of the salt. Treatment with acids or biological agents, on the other hand, produced a bleached and fragile weathered border that was amorphous to X-rays. Electron microprobe analysis showed that the bleached zone was depleted of Fe, Mg, and Al, besides the interlayer K ions; concentration of these cations decreased towards the extremity of the edge. The amorphous nature of the weathered zone is attributed to the loss of the unit cell periodicity resulting from the removal of a portion of the octahedral and tetrahedral cations. (Knapp-USGS)

FIELD DETERMINATION OF SULFATE CONTENT IN SOILS,
California State Dept. of Water Resources, Sacramento.
H. J. Miller, and D. G. Knight.
Tech Memo No 37, Dept Water Resour, Calif, Jan 1969. 10 p, 4 fig, 1 plate, 1 ref, 2 append.

Descriptors: *Chemical analysis, Chemical precipitation, Gypsum, *Sulfates, Test procedures, Volumetric analysis, Quantitative analysis, Soil analysis, Soil investigations, *Soil tests, Field tests, Subsurface investigations, Engineering geology, Soluble salts, Soil chemistry.
Identifiers: Sulfate attack.

A rapid chemical test, developed for determining sulfate in natural soils, is based on the direct relationship between sulfate content and the volume of white precipitate. The soil sample is placed in 3N HCl to dissolve the sulfate, the solution is filtered into a graduated test tube, and barium chloride is added to the filtrate to precipate the sulfate. The volume of the precipitate is read directly in the test tube. Test tubes are calibrated with standard samples. A testing kit developed for field use is described. (USBR)

EFFECT OF LIGHT INTENSITY ON PHOTOSYNTHESIS BY THERMAL ALGAE ADAPTED TO NATURAL AND REDUCED SUNLIGHT,
Indiana Univ., Indianapolis. Dept. of Microbiology.
Thomas D. Brock, and M. Louise Brock.
Limnol and Oceanogr, Vol 14, No 3, p 334-341, May 1969. 8 p, 7 tab, 19 ref.

Descriptors: *Photosynthesis, *Algae, *Thermal springs, *Light intensity, Spring water, Water chemistry, Water temperature, Chemical analysis, Analytical techniques, Cloud cover, Spectroscopy, Ultraviolet radiation, Transmissivity, Chlorophyll.

The effect of light intensity on thermal algae of hot springs of Yellowstone National Park was investigated by measuring autoradiography of photosynthetic activity of cells at different levels in the algae mat. The rate of photosynthesis decreases progressively with decreasing light, although the most efficient use is at 7-14% of full sunlight. The chlorophyll content of the algae at the surface of the mat increases rapidly; however, the chlorophyll content of the mat increases slowly or not at all. Although individual algae cells can adapt rapidly to changes in light, the entire population, because of its existence in compact mats, adapts slowly. At the latitude of Yellowstone there is sufficient light throughout the whole year to stimulate the algae growth even at critical temperatures. (Gabriel-USGS)

CHEMICAL SEPARATION AND SPECTROCHEMICAL DETERMINATION OF MICROGRAM QUANTITIES OF GERMANIUM IN NATURAL WATER OF HIGH HEAVY-METAL CONTENT,
Geological Survey, Sacramento, Calif.
Alex E. Dong.
Geol Surv Ann Rev, Short Pap Contrib, 1969.

Descriptors: *Germanium, *Trace elements, *Spectroscopy, *Water chemistry, Geochemistry, Chemical techniques, Saline water, Heavy metals.
Identifiers: Chemical separation, Natural water.

A procedure is described for the chemical separation and determination of microgram quantities of germanium in water of high heavy-metal content. Before being subjected to spectrochemical determination, germanium is selectively isolated from other major and minor elements in water in order to avoid undesirable dilution effects. The average error for 8 determinations is about 8.5% and the relative standard deviation is 8.0%.

THE CALCIUM, MAGNESIUM, POTASSIUM, AND SODIUM BUDGETS FOR A SMALL FORESTED ECOSYSTEM,
Dartmouth Coll., Hanover, N.H. Dept. of Biological Sciences.
G. E. Likens.
Ecology, Vol 48, No 5, p 772-785, 1967. 8 fig, 11 tab, 41 ref.

Descriptors: *Calcium, *Magnesium, *Potassium, *Cycling nutrients, *Ecosystems, *Forests, New Hampshire.
Identifiers: Cation losses, Balance (Exchangeable bases), Weathering rates, Hubbard Brook Experimental Forest (NH), New Hampshire.

The balance of exchangeable bases was studied in six watersheds of the Hubbard Brook Experimental Forest, N H, forested by northern hardwoods, with some spruce and fir at higher elevations. Samples of precipitation and stream water were collected from June 1963 until June 1965. The budget of dissolved cations was calculated from input (concentration of cations times volume of precipitation) and discharge (concentration of cations times volume of runoff). During 1963-1965, the average annual inputs (in kilograms/hectare) were: calcium (Ca) 2.9, magnesium (Mg) 0.9, potassium (K) 2.15, sodium (Na) 1.55, while the discharge averaged calcium 5.95, magnesium 2.2, potassium 1.45, and sodium 5.2. The net loss of calcium, magnesium, and sodium represents conservative measurement of weathering. The potassium budget approaches balance, and this cation may serve as the sensitive index of biological activity. (Wilde-Wis)

THE CONCEPT OF PRODUCTIVITY IN BIOLOGY (GERMAN),
August Thienemann.
Archiv fur Hydrobiologie, Vol 22, p 616-622, 1931.

Descriptors: *Productivity, Fertility, Aquatic productivity, Lakes, Ponds, Nutrients, Harvesting.
Identifiers: Productive potential, Actual productivity, Site quality.

This is a discussion of the manifold meaning of the term 'productivity', or 'site quality' of different media of production, including lakes and ponds. This expression in hydrobiology, as in forestry or farming, involves several concepts: 'fertility of a medium,' referring primarily to the supply of available nutrients; 'productive potential,' implying a possibility of utilization of the medium by suitable forms of life, i.e., fish, trees, or farm crops; 'actual productivity,' depending to a large degree upon the organisms which at the present occupy the substrate, their rate of growth and value to man. In many instances, the actual productivity of a medium is far below its productive potential. (Wilde-Wis)

IONIC COMPOSITION OF SAGEHEN CREEK, CALIFORNIA, FOLLOWING AN ADJACENT FIRE,
California Univ., Berkeley. Dept. of Soils and Plant Nutrition; and California Univ., Berkeley. Dept. of Zoology.
C. M. Johnson, and P. R. Needham.
Ecology, Vol 47, No 4, p 636-639, Summer 1966. 2 fig, 2 tab, 8 ref.

Descriptors: *Ions, *Streams, *Forest fires, Hydrogen ion concentration, Bicarbonates, Calcium, Magnesium, Sodium, Potassium, California, Springs, Water chemistry.
Identifiers: Sagehen Creek (Calif), Donner Ridge (Calif), Sagehen Basin (Calif).

Water samples from Sagehen Creek, Calif, were collected at biweekly intervals for two years following the Donner Ridge forest fire which burned over the lower part of Sagehen Basin in 1960. Sampling included a spring which feeds the stream above the burned area and two sites in the stream, one above the burned area below the spring, and one within the burned area. Analyses included pH, bicarbonate, calcium, magnesium, sodium, and potassium. Seasonal variation in ionic composition was observed at both sampling sites. In contrast to the constant composition of the spring water for the two year period, the ionic concentration in the samples was inversely related to streamflow. In summer, streamflow was low and stream ionic concentrations equalled or exceeded those of the spring water. During runoff from melting snow (March-June), streamflow increased greatly and ionic concentration decreased. There was no specific effect of the fire on the ionic composition of the stream. It is postulated that ash constituents were dissolved by light rainfall and leached into the permeable forest soil before the first snow. Because of acid soil, the dissolved cations were adsorbed by exchange colloids rather than washed into the stream. (Wilde-Wis)

ASSAY OF UREASE ACTIVITY USING CARBON 14-UREA IN STORED, GEOLOGICALLY PRESERVED, AND IN IRRADIATED SOILS,
California Univ., Berkeley. Dept. of Soils and Plant Nutrition.
J. J. Skujins, and A. D. McLaren.
Soil Biology and Biochemistry, Vol 1, p 89-99, 1969. 8 fig, 3 tab, 34 ref.

Descriptors: *Soils, *Soil analysis, Nitrogen cycle, Enzymes, Irradiation, Carbon, Hawaii, Radioisotopes, Radioactive dating, Puerto Rico, Alaska.
Identifiers: *Urease activity, *Carbon-14, Sample storage, Sterilization, Hilgard soil collection.

During a period of 26 months of air-dry storage of Hawaiian and Puerto Rico latosols, one soil showed an increase in activity to 108.5% and others a decrease to as little as 36%. Urease activity found in 6 to 12 years stored, air-dry agricultural soils correlated with the organic matter content rather than with the numbers of microorganisms. In samples from the 60-years-old Hilgard soil collection, urease activity reflected both the organic carbon content and the numbers of organisms present. Measurable urease activities were detected in 8715 and 9550-years-old, radiocarbon dated, Alaska permafrost samples. No activity was detected in a 32,000-years-old sample. No urease activity was present in two high-salinity soils. Urease acti was usually found in neutral soils. A high-ene electron-beam irradiation dosage of 4 Mrad creased urease activity in some soils, but decrea activity in two others. Doses of 8 Mrad decrea urease activity below their native levels in all s Evidently, an intracellular urease compon becomes more accessible to substrate upon de of organisms. A new method for urease acti determination in soils was devised, based on the tection of carbon-14-labelled carbon diox release from carbon-14-urea-amended s (Keeney-Wis)

ANGES IN THE WATERS OF THE DANUBE GION IN THE BLACK SEA AND THE EFCT ON ANCHOVY BREEDING,
essa State Univ. (USSR). Dept. of Hydrobiolo-

L. El'-Sayed.
nsl by Scripta Technica from Okeanologiya, ad Nauk, SSSR, Vol 8, No 4. Oceanology, Vol 8, 4, p 569-572, 1968. 4 p, 2 fig, 8 ref.

scriptors: *Mixing, *Spawning, *Water temature, Density stratification, Freshwater, Saline ter, Salinity, Limnology, Fish reproduction, eding.
ntifiers: *Anchovy spawning, Danube River, ck Sea.

ree major rivers which discharge water into the thwest part of the Black Sea are the Danube, ieper, and Dniester. The mixing of fresh and ne water produced a visible stratification of er masses. The following water zones were ntified: (1) River water with a salinity of up to 6-; (2) Surficial seawater with a salinity of 12-5% acid; (3) Bottom water with a salinity of 5%. Water samples were collected from the ious water zones during 1966 and 1967 in order establish relationships between temperature, nity, and biological factors. It was concluded t there is a close relationship between salinity, nperature and distribution of spawning anchos in the selected area. The number of anchovy wn was dependent upon the stage of water mix-. The highest number of anchovy spawn was nd in a salinity of 16.7-17.3% and a water temature of 24-26 deg C. The least number was recorded at the mouth of the Danube River where the salinity was between 1-4%. The winds are important in the mixing process and, therefore, in the areal distribution of anchovy spawn. (Carstea-USGS)

3A. Saline Water Conversion

ION EXCHANGE IS FEASIBLE FOR DESALINATION,
Federal Water Pollution Control Administration, Washington, D.C.
Jacob I. Bregman, and James M. Shackelford.
Environ Sci Tech, Vol 3, No 4, p 336-340, Apr 1969. 5 p, 4 fig.

Descriptors: *Demineralization, *Ion exchange, Dissolved solids, Ions, Saline water, Acids, Alkalis (Bases), Water costs, Economics, pH, *Desalination, *Desalination processes, Water treatment, Water quality, Water chemistry, *Waste water treatment.
Identifiers: Anions, Deionization.

Ion exchange of waste waters having low amounts of total dissolved solids is more economically feasible than chemical regeneration. The recent revival of ion exchange as a desalination process may be attributed to: (1) development of high-capacity ion exchangers for demineralization; (2) development of ingenious techniques for efficient use, recovery, and reuse of resin regenerants; and (3) introduction of exotic, nonresin, ion exchange techniques. New processes using these approaches include the Desal, Sul-bi-Sul, Sirotherm, continuous ion exchange, and liquid ion exchange. Each process is discussed separately. The liquid ion exchange process is particularly adaptable to the removal of magnesium because the system can be made highly selective for that ion. The continuous ion exchange process may be installed for 20% less cost than conventional bed units and requires about one-third less space. One such unit costs $0.10/1000 gal for producing water with 2 ppm total dissolved solids from water containing 250 ppm total dissolved solids. (USBR)

SOLVENT STABILITY AND RECOVERY IN SOLVENT EXTRACTION DESALINATION,
Texas A and M Univ., College Station.
R. R. Davison, and W. H. Smith.
Office Saline Water Res and Develop Progr Rep No 371, Aug 1968. 64 p, 14 fig, 13 tab, 15 ref. OSW Contract 14-01-0001-1180.

Descriptors: *Solvent extractions, *Desalination processes, *Analytical techniques, Ion exchange, Distillation, Gas chromatography, Solvents, Stability, Water temperature, Ozone, Oxygen, Nitrogen, Indicators, Volumetric analysis.
Identifiers: Solvent stability, Amine extraction, Amine analysis.

Studies were undertaken to determine the chemical stability of amine solvents which are used in desalination of seawater, and methods of amine removal from the resulting freshwater. Five secondary and tertiary amines C5 and C6, purified by distillation, were used as experimental materials. The effects of temperature, oxygen, nitrogen, and amine-water mixtures upon stability of selected amines were studied. The degradation of amines was measured by water solubility or cloud points and by gas chromatography. It was concluded that the degradation of amines at 60 deg C was higher than at room temperature. Further, degradation was higher in the presence of oxygen than nitrogen. Therefore, a decrease in oxygen in the system will result in a decrease of amine degradation. The removal of amine solvents from water was investigated by steam stripping, biological methods, ion exchange and ozonation. Trickle filters were found suitable for removal of amine residues, but yeasts, molds and algae apparently reduced the effectiveness of the filters. Laboratory experiments showed that distillation was very effective in amine removal and the process was not pH dependent. However, a few ppm of amine hydrochloride may remain in the product. The ozonation method was neither efficient nor economical. In contrast, the ion exchange method appears to be very effective and economical for removing amines from water. A buffered bromcresol green reagent method used for amine analysis in water is discussed. (Carstea-USGS)

3B. Water Yield Improvement

TIMING OF THE APPARENT EFFECTS OF CLOUD SEEDING,
California Univ., Berkeley. Statistical Lab.
Jeanne L. Lovasich, Jerzy Neyman, Elizabeth L. Scott, and Jerome A. Smith.
Science, Vol 165, No 3896, p 892-893, Aug 29, 1969. 2 p, 1 fig, 1 tab, 7 ref.

Descriptors: *Cloud seeding, *Artificial precipitation, *California, Rainfall, Rain gages, Precipitation (Atmospheric), Temperature, Evaporation, Convection, Weather modification, Water yield.
Identifiers: Cloud seeding effects.

The average hourly precipitation amounts, on 96 experimental days without cloud seeding in the Whitetop experiment, California, show a marked maximum between 4 and 7 o'clock in the afternoon, presumable reflecting the convection activity caused by heating of the ground occurring during an earlier period. No such maximum is observed on the 102 days with seeding. The hypothetical explanation presupposes that seeding with silver iodide creates early general cloudiness, which prevents ground temperatures from rising to levels usually attained on days without seeding. This hypothesis may explain not only the mechanism of the loss of rain in the Whitetop experiment, apparently induced by seeding, but also may explain certain phenomena noticed in another experiment. (Knapp-USGS)

PERFORMANCE OF AN ATMOSPHERIC WATER RESOURCES RESEARCH PROGRAM IN THE HUNGRY HORSE AREA, MONTANA, 1967-68 SEASON.

N Amer Weather Consult, Goleta, Calif, Rep No 97, Nov 1968. 51 p, 14 fig, 10 tab, 7 ref, 2 append.

Descriptors: Atmospheric precipitation, *Cloud seeding, *Snowfall, Benefit-cost ratios, Economics, Storms, Meteorology, Montana, Snowpacks, Streamflow, Temperature, Silver iodide, Runoff, Snowmelt, Performance, Snow, *Weather modification, *Artificial precipitation.
Identifiers: *Atmospheric research, Water content, Kalispell (Mont), Ice nuclei.

Hungry Horse Project is one of the first operational adaptation research projects undertaken as part of the Bureau of Reclamation's Atmospheric Water Resources Program. Hungry Horse Basin, in northwestern Montana, was chosen for such a program because of potential high economic yields from small increases in precipitation over this basin. Seeding operations performed from Oct 1967 through Apr 1968 are discussed. Results of the program are evaluated in terms of streamflow, snowpack water content, analysis of silver content in snow, and investigation of nuclei climatology. Equipment design and construction, functional requirements of each general type of station, and overall system functional capabilities are enumerated. (USBR)

CONSERVATION DISTRICT ACT.

Ill Ann Stat ch 57 1/2, secs 101-121 (Smith-Hurd Supp 1969).

Descriptors: *Illinois, *Conservation, *Land management, *Administrative agencies, Land resources, Natural resources, Legislation, Financing, Legal aspects, Water law, Project purposes, Recreation, Administration, Wildlife, Wildlife conservation, Habitats, Project planning, Projects, Resource development.
Identifiers: *Conservation districts.

On petition of the voters of a county not organized as a forest preserve district, a conservation district may be formed to promote the conservation of nature, flora and faunna, natural environment, and natural resources of the district. The district's management shall consist of five trustees who serve a five year term. The State Conservation Department shall guide and consult with every district in matters relating to conservation and recreation policies and plans. Every district has the power to enter into contracts; acquire real property; make and publish ordinances; and study the district's wildland and other open space resources with respect to preservation of such resources. Each district is to be financed by an annual levy of taxes on property within its jurisdiction, and when necessary bonds may be issued. (Johnson-Fla)

MICROMETEOROLOGICAL METHODS AS TOOLS FOR INCREASING CROP PRODUCTION AND WATER-USE EFFICIENCY,
Agricultural Research Service, Kimberly, Idaho. Snake River Research Center.
James L. Wright.
Pap, Proc Eighteenth Annu Fertilizer Conf Pac Northwest, Twin Falls, Idaho, July 1967. 8 p, 11 ref.

Descriptors: *Crops, *Crop production, *Agronomic crops, Efficiencies, Water utilization, *Micrometeorology, *Meteorology, Microclimatology, Evaporation, Microenvironment, *Irrigation practices, Water management (Applied), *Agronomy, Irrigation efficiency, Plants, Energy balance, Agriculture, Farm management, Environment, Irrigation.

Application of micrometeorological methods to problems of agronomic importance has increased the understanding of physical processes controlling the natural environment of plants. Methods and the basic information gained from using these methods illustrate the importance of microclimatic factors and indicate the applicability to problems of practical importance. Results of micrometeorological studies have increased our understanding of such things as partitioning energy at the surface of the earth, factors controlling the rate of evaporation of water from the surface of the earth, and effects of management practices upon the microclimate of a plant community. A deeper understanding of these basic factors increases the possibility of obtaining (1) more efficient use of water, (2) greater and more economical crop production through improved irrigation management practices, (3) modification of the natural microclimate of a crop, and (4) development of improved crop types that will maximize the beneficial factors of the microclimate. SALT BALANCE, IRRIGATION EFFICIENCY, AND DRAINAGE DESIGN,
Herman Bouwer.
Proc Amer Soc Civ Eng, J Irrig Drain Div, Vol 95, No IR1, p 153-170, Mar 1969. 18 p, 4 fig, 3 tab, 27 ref, 2 append.

Descriptors: *Salt balance, *Irrigation efficiency, Salts, Irrigation, *Drainage engineering, *Drainage systems, Drainage, Evapotranspiration, Irrigation systems, Leaching, Saline soils, Salinity, Water utilization, Water table, Root zone, Crops, Water requirements, Consumptive use, Salt tolerance, Time, Bibliographies.
Identifiers: Irrigation requirement, Salt removal.

A simplified procedure is presented to predict the amount of irrigation water necessary (in addition to that for evapotranspiration) to maintain salt balance in the root zone. Key factor in the procedure is the leaching efficiency, ranging from 0.2 for fine-textured soils to 0.6 for coarse-textured soils. Also taken into account are the salt tolerance of the crop, salt concentration of the irrigation water, and evapotranspiration. The procedure predicted accurately the known leaching requirements for salt balance of 3 irrigated regions. In defining irrigation efficiency, distinction is made between an efficiency of water utilization and an efficiency of water application. Drainage flow from the root zone decreases after irrigation. The water table response of a system of parallel drains to this flow can be computed for the design of a drainage system to avoid high water tables. (USBR)

A NOTE ON MORAN'S PROBABILITY THEORY OF DAMS AND STORAGE SYSTEMS,
City Univ., London (England).
C. Venetis.
Water Resources Res, Vol 5, No 3, p 884-887, Aug 1969. 4 p, 2 fig, 2 ref.

Descriptors: *Reservoir operation, *Water storage, *Reservoir yield, *Probability, Reservoir design, Streamflow forecasting.
Identifiers: Moran's theory (Reservoirs).

The distribution of the reservoir content is examined in discrete time and continuous state space for constant release. Empty and full reservoir probabilities are expressed by the Dirac delta function. The distribution of the reservoir content is obtained by convolution, taking into account the constraints in the range of variation of the content of the finite reservoir that may not meet the demand. The case of nonzero probabilities of zero inflows is briefly discussed, and the equations for the discrete case are derived from those of the continuous by substituting summations for the integrals. SOME EFFECTS OF MAN-MADE CONTROLS IN THE UPPER REACHES OF A SMALL DRAINAGE BASIN,
Mississippi State Univ., State College. Dept. of Civil Engineering; and Mississippi State Univ., State College. Water Resources Research Inst.
Adnan Shindala, and Melville S. Priest.
Water Resources Bull, Vol 5, No 2, p 3-9, June 1969. 7 p, 5 fig, 1 ref. OWRR Proj A-023-MISS.

Descriptors: *Watershed management, *Flood control, *Reservoir operation, *Channel morphology, Width, Erosion, Floods, Streamflow, Cross-sections, Profiles, Peak discharge.
Identifiers: Watershed management effects.

Governmental agencies have been instrumental in the construction of numerous dams and other control structures in the small watersheds of the State of Mississippi. Although some of the consequences are predictable, there are some effects which are not yet well defined. The physical effects of such works on a particular stream and its channel are described. As was anticipated, peak discharges appear to have been somewhat reduced. Changes in channel cross-section depend, to some extent, upon location along the stream. However, there appears to have been a narrowing of the channel in that portion of the stream for which cross-sections were available. (Knapp-USGS)

CONTROL OF TEMPERATURES OF WATER DISCHARGED FROM A MULTIPLE-PURPOSE RESERVOIR,
Corps of Engineers, Vicksburg, Miss.
J. B. Middleton.
Reservoir Fish Resources Symp, Georgia Univ, Apr 5-7, 1967, p 37-46, 1967. 10 p, 5 fig.

Descriptors: *Temperature control, *Reservoir design, Multiple-purpose reservoirs, *Reservoir operation, *Stream fisheries, Reservoir construction, Water temperature, Intake structures.
Identifiers: Stream fisheries conservation.

The control of temperatures of water discharged from multiple-purpose reservoirs is now accepted as one of the goals of the reservoir planner in those cases where this is necessary to avoid damage to downstream fisheries. The planning and design of DeGray Reservoir on the Caddo River in south-central Arkansas was coordinated with interested agencies from the earliest stages. From this planning has evolved a design of an intake structure which may be utilized to control, within a wide range, the elevations from which discharges are withdrawn. This feature, together with a downstream regulating dam, is expected to make practical the preservation of the existing downstream fishery. (Carstea-USGS)

e existence and areal extent of subsurface stormw was studied on a 60-acre forested watershed in Georgia Piedmont. Between January 1967 and rch 1968, 14,519 moisture readings were obned from 42 sites on the watershed. To a maxum depth of 20 feet below the soil surface. drographs were separated into stormflow and eflow by a standardized slope of 0.05 csm/hr. m 55 rain storms during the study period, 36 l stormflow volumes equal to channel precipitan, with no evidence of overland flow. Stormflow l channel expansion sometimes continued after nfall had ended. During larger storms, lateral surface flow caused a rapid rise of the groundter table only in the vicinity of the perennial ing heads. Elsewhere the groundwater table, at ths greater than 30 feet, showed only seasonal ctuations up to 3 feet with maximum levels in y. The annual moisture cycle in the soil exssed itself as a sine curve down to 20 feet depth. ximum moisture constant was reached in March he top 3 feet, and in June at 12 feet in the soil ntle. The upper 3 feet showed the most imdiate response to rainfall. Soil moisture concenions below 3 feet lagged in their response. At 12 t this lag was 3 months. Rapid vertical flow of isture cannot be assumed under such condis. Increase in moisture after rain in the upper 3 t of soil was greater as distance from the channel reased indicating that rain was stored upslope released down slope. With lack of rapid vertical colation downward through the soil mantle, er must have drained laterally from the lower tions of the slope. Therefore, contribution of surface flow to direct runoff decreased with ance from the channel, and was detectable by iodic soil moisture measurement only in the er 3 feet of the soil mantle. Direct runoff mes from the seven largest storms varied from 30 per cent of gross precipitation; the average centage from all storms was 8 per cent of gross cipitation. The study was a unique analysis of variability of the source area for stormflow on entire watershed, proving that the variable rce area concept is a valid representation of the infall-runoff relation.

OT PLANNING STUDY FOR AREA WIDE RM DRAINAGE PLANNING.
ght-McLaughlin Engineers, Denver, Colo.

t Planning Study for Area Wide Storm nage Planning, Volume II, April 1969. 76 p, 3 14 tab.

criptors: *Planning, *Water management (Appl), *Flood control, *Drainage, Drainage ms, Flood plain zoning, Methodology, Estied costs, Legal aspects, Multiple-purpose pro, Regional analysis, Hydrograph analysis, Unit ograph, Detention reservoirs, Channels, Con.
tifiers: *Boulder (Colo), *North Boulder o), *Environmental design.

pilot planning study includes the development methodology for the preparation of an area storm drainage plan, a study of alternate solu to the North Boulder, Colorado major age problems, preparation of storm drainage er plans for five North Boulder waterways, lopment of a financing strategy and a practical of the recently completed Urban Storm nage Criteria Manual. North Boulder was en as a pilot study because it represented most of the urban drainage problems found in the Denver region and because it had no flood plain management program, policy, or regulation ordinances. The problem was defined hydrologically and hydraulically by field and office studies to develop all practical alternates and to study these alternates using a qualified environmental design team approach. Economics, comprehensive plans and programs of the city and county, open space needs, greenbelt requirements, and legal aspects of urban storm drainage were all taken into consideration when evaluating alternates. A detailed discussion of the Colorado Urban Hydrograph Procedure, which was used in determining flood magnitudes was given. The report is contained in two volumes: Volume one contains the text of the report and Volume two contains thirty detailed drawings of the proposed Wonderland Creek Drainage. (Marriott-Chicago)

CUTTING TIMBER ON SWAMPS AND OVERFLOWED LANDS.

Ark Stat Ann sec 10-301 (1956).

Descriptors: *Arkansas, *Lumbering, *Swamps, *Forest management, Lumber, Legislation, Legal aspects, Federal government.
Identifiers: Penalties (Criminal).

It is unlawful to cut, destroy or remove any timber standing on any of the swamp and overflowed lands granted by Congress to the state. Criminal penalties are provided for violation of the foregoing provision. Any person who resides on such swamp or overflowed lands may cut timber growing on the tract which he occupies for his own use for building or farming purposes. (Keith-Fla)
W69-09778

SALE OF SWAMP AND OVERFLOWED LANDS.

Ark Stat Ann 10-801 thru 10-807 (1956).

Descriptors: *Arkansas, *Swamps, Legislation, Legal aspects, Wetlands, Appraisals, Administrative agencies, Federal government, Adoption of practices, Boundaries (Property), Beds.
Identifiers: *Overflowed lands.

The commissioner of state lands is authorized to sell lands granted by Congress to the state under the designation 'Swamp and Overflowed Lands.' On application to purchase any such lands, the commissioner will determine whether or not the land is wild and unimproved. If the land is found to be wild and unimproved, then it will be appraised. The method for price determination of such land is specified for different classes of purchasers. It is provided that money from sales be credited to the swamp land fund. Provision is made for the handling of conflicting claims. (Keith-Fla)
W69-09779

AUTHORITY OF CITIES TO OPERATE HARBORS AND PORTS; CREATION OF PORT AUTHORITIES.

Ark Stat Ann secs 19-2701 thru 19-2748 (1968).

Descriptors: *Arkansas, *Port authorities, *Administration, *Structures, Legislation, Legal aspects, Cities, Harbors, Eminent domain, Condemnation, Financing, Right-of-way, Bridges, Multiple-purpose projects, Administrative agencies, Levees, Docks, Piers, Construction, Maintenance, Navigation.
Identifiers: Riparian terminals.

Cities are authorized to establish, construct, and regulate landing places, levees, wharves, docks, piers, and basins for the proper regulation of the navigation, trade, or commerce of such city. Cities may also purchase, construct, and operate any ports, harbors, river-rail terminals, barge terminals, or any other structures convenient to the carrying on of commerce. Cities may create port authorities to carry out the foregoing powers. Any of the foregoing structures or property for the construction thereof may be acquired by the city through exercise of the power of eminent domain. Specific provisions indicate how the acquisition or construction of any of the foregoing structures is to be financed. The general purposes for which port authorities may be created are enumerated as are the powers of such authorities. Any combination of cities and counties in or out of the state may exercise the foregoing powers for the purposes aforementioned. Special methods of financing are provided for such joint efforts. STAUFFACHER V CITY OF SUN PRAIRIE (RIGHTS TO A DRAINAGE EASEMENT).
168 NW 2d 587-588 (Wis 1969).

Descriptors: *Wisconsin, *Drainage, *Easements, *Assessments, Legal aspects, Judicial decisions, Storm drains, Cities, Ditches, Drainage water, Sewers, Contracts, Damages, Construction, Construction costs, Maintenance, Maintenance costs, Operation and maintenance, Local government, Water conveyance, Waste water disposal.
Identifiers: Injunction (Prohibitory).

Plaintiff's predecessors in title made an agreement with the defendant concerning a drainage easement. Plaintiff alleged that the easement was granted upon the condition that the defendant would not assess the landholders or their heirs or assigns, the plaintiffs, for any improvements made

to the drainage ditch. The defendant assessed plaintiff's land for sewer construction and plaintiff sought injunctive relief. The trial court dismissed the complaint holding that the covenant only prohibited an assessment for a ditch and not one for a sewer and thus had not been violated by defendant. The trial court also held that the defendant had no power to acquire an easement for public purposes by freeing the abutting land from an assessment for the construction of the easement. On appeal the court agreed with the trial court's determination that the easement was for a drainage ditch and not a sewer line. However, they disagreed with the lower court's conclusion respecting the defendant's ability to acquire the easement and reversed the judgment with leave for plaintiffs to amend. (Shevin-Fla)

RIVER FRONT IMPROVEMENT COMMISSION.

Iowa Code Ann secs 372.1-372.17 (1949), as amended, (Supp 1969), sec 372.18 (Supp 1969).

Descriptors: *Administrative agencies, *Rivers, *Planning, *Iowa, Wharves, Riparian rights, River beds, City planning, Dams, Construction, Legislation, Meanders, Streams, Taxes, Financing, Beds, Ownership of beds, Regulation, Flood control, Water resources development, River regulation, Dams, Cities.
Identifiers: *Title, *Improvements.

Five hundred electors in certain specified classes of cities may petition the governor to appoint a river-front improvement commission. Title to streams shall vest in the commission to the extent that such streams border on or are included within the city. Title to the beds of these streams remains in the state, and riparian rights are not effected. Title to non-meandered streams may be acquired by purchase or condemnation. The commission may: redeem lands between meandered lines or lands in the channel of any stream that is not meandered; construct, regulate and maintain dams; and provide for a channel adequate to carry flood waters. The commission may adopt plans: for the improvement of such river channel and banks; reclaiming of land; and the construction of dams. The commission may acquire real estate and riparian rights. Bonds may be issued to finance such purchases. Regulations or ordinances may be prescribed for the government of such public grounds. (Darragh-Fla)

ZABEL V TABB (PERMIT TO DREDGE AND FILL IN NAVIGABLE WATERS).

296 F Supp 764-771 (MD Fla 1969).

Descriptors: *Florida, *Landfills, *Rivers and Harbors Act, *Navigation, Dredging, Navigable waters, Submerged lands, Ownership of beds, Channels, Bridges, Administrative agencies, Conservation, Bays, Beach erosion, Floods, Wildlife, Ecology, Harbors, Federal government, Permits, Legislation, Culverts, Judicial decisions, Legal aspects, Administrative decisions.
Identifiers: Obstruction to navigation, Intracoastal waterways, Corp of engineers.

The plaintiffs applied for a permit under the Rivers and Harbors Act to dredge and fill in navigable waters. Their application was denied and plaintiffs sought judicial relief. Title to the submerged land rested in the plaintiffs and they obtained consent to do the work from all local agencies concerned. The facts showed that the work would have no detrimental effect on navigation. No effect would be rendered on erosion or flood heights, but the secretary found there would be a detrimental effect to wildlife and denied the petition. The court acknowledged that it could not overturn the decision of an administrative agency unless it was contrary to law as not within the discretion of the agency. The court stated that the act only gave defendants authority to refuse a permit when there would be a detrimental effect to navigation. Defendants contended that they should be able to apply the Fish and Wildlife Coordination Act and deny the permit for reasons other than navigation. The court held that the legislation did not give the defendants the authority to deny a permit for dredge and fill where they had factually determined that the proposed construction would not interfere with navigation. The court decided that it had jurisdiction to grant the plaintiffs relief. (Shevin-Fla)

CITY OF COON RAPIDS V SUBURBAN E GINEERING INC. (FAILURE TO ME SPECIFICATIONS FOR A DRAINA SYSTEM).

167 NW 2d 493-497 (Minn 1969).

Descriptors: *Minnesota, *Storm drains, Sewe Closed conduits, Pipes, Drainage, Local gover ments, Cities, Judicial decisions, Damag Remedies, Legal aspects, Specifications, Mai tenance, Repairing, Drainage systems.

Before defendants could carry out plans to devel and sell land to the public within plaintiff city, was necessary to install an adequate storm sew system. Plaintiff agreed that if defendants would stall a sewer system according to certain specific tions, the city would accept it and bear the expen of future maintenance. The sewer system was stalled and defendants assured plaintiff that t specifications had been fulfilled. There was so question as to whether the plaintiff in accepting t sewer system relied on this representation or on t report of their own engineer who apparently or made a cursory insepction of the system. So time later, after continued repairs, plaint discovered the sewer was not built according specifications and filed a suit for damages. T lower court, being of the opinion that the statute limitations had run and that claims of fraud we merely attempts to disguise the true cause of a tion, granted defendants motion for summa judgment. Plaintiff appealed and the court revers and remanded the case holding that there was su cient evidence of fraud to preclude a summa judgment. (Gabrielson-Fla)

IGATION AND WATERS.

at Ann tit 25, secs 201-207, 241-246 (1959).

Descriptors: *Vermont, *Logging, *Lumbering, *Obstruction to flow, Legislation, Regulation, Lumber, Timber, Streams, Banks, Non-consumptive use, Riparian rights, Water utilization, Properties, Damages.
Identifiers: Penalties (Civil).

General provisions cover the anchoring of log booms on land bounding upon the river or stream down which logs are run. Lodged lumber not taken away by the owner before May 1, may be retained by the landowner until he is paid for damages suffered. If the lumber is not removed by November 1, the landowner may take the lumber and convert it to his own use; however, he must first advertise the lumber in the town where the lumber is lodged. When the landowner and lumber owner cannot agree upon damages, the town selectmen shall make a final adjustment. In the case of damage by floating lumber, either party may also prefer a petition to the public service commission, which shall determine the cause of property damage. The county court shall render judgment. Foreign corporations must post bond before floating lumber down the rivers and streams of the state. Penalties for violations of these provisions are provided. (Moulder-Fla)

FLOOD CONTROL.

Ark Stat Ann sec 17-315 (1968).

Descriptors: *Arkansas, *Flood control, *Flood protection, *Eminent domain, Water management (Applied), Control structures, Check structures, Levees, Reservoirs, Easements, Legal aspects, Legislation, Condemnation, United States, Local governments, Construction.

The county governments of the state may enter upon and take lands, or easements on lands, by purchase, grant, donation, devise or eminent domain for the purpose of locating, constructing and managing floodways, reservoirs, spillways, levees, or other flood control improvements. If eminent domain must be exercised to acquire lands or interests therein, the county government shall proceed as provided by statute. Nothing in this act shall be construed to relieve the United States of any responsibility or liability which it has assumed by the federal flood control acts. (Kelly-Fla)
W69-09823

ACQUISITION OF UTILITIES AND RECLAMATION OF PREVIOUSLY SUBMERGED LAND BY CITIES.
Ill Ann Stat ch 24, secs 11-123-1 thru 11-123-7, 11-123-10, 11-123-20, 11-123-21, 11-123-22, 11-123-24 (Smith-Hurd 1960) as amended (Supp 1969).

Descriptors: *Illinois, *Land reclamation, *Ownership of beds, *Utilities, Cities, Waterworks, Public utilities, Legislation, Condemnation, Rivers, Levees, Canals, Docks, Piers, Harbors, Breakwaters, Channels, Right-of-way, Land forming, Accretion (Legal aspects), Water utilization, Beds, Administration, Reclamation.
Identifiers: Public waters, Harbor development, Harbor structures.

The term 'utility' is defined as including harbors, canals, slips, wharves, docks, levees, piers, quay walls, breakwaters, and all appropriate harbor structures. The term 'artificially made or reclaimed land' is defined to include all land which formerly was submerged under the public waters of the state, the title to which is in the state, and which has been artificially made or reclaimed, in whole or in part, contrary to law. Any city may acquire utilities by purchase, condemnation, or otherwise and may operate utilities located within its jurisdiction or in, over, and upon public waters bordering thereon. Specific provisions for reclamation by a city of specified submerged land and artificially made land are made to enable the city to operate utilities. Accretions or artificially made or reclaimed land which are formed or added to any utility constructed under the foregoing authority become the property of the city. A city is empowered to condemn any land or right-of-way for the purpose of widening, deepening, or otherwise improving a river or harbor. (Keith-Fla)
W69-09824

WATER SUPPLY, DRAINAGE FLOOD CONTROL.

Ill Ann Stat ch 34, secs 3115-3123 (Smith-Hurd 1960), as amended, (Supp 1969).

Descriptors: *Illinois, *Water supply, *Sewage, *Flood control, United States, State governments, Local governments, Water pollution, Financing, Waterworks, Maintenance, Planning, Treatment facilities, Pollution abatement, Regulation, Water resources.

The county board may cooperate with federal agencies, municipalities, and political subdivisions of this state for planning, construction and improvement of flood control, water supply and sewage facilities. The board has authority to prevent water pollution and to cause any person, party or corporation to halt activities resulting in pollution. Bonds may be issued for financing and are to be paid off by use of revenues from waterworks or sewage treatment facilities. Rates for use shall be sufficient to provide funds for the maintenance and depreciation of facilities and for the payment of the principal and interest on bonds. Rules and regulations for use are promulgated by ordinance. (Darragh-Fla)
W69-09825

INDIVIDUAL DRAINAGE RIGHTS.
Iowa Code Ann, secs 465.1 to 465.29 (1949), as amended, (Supp 1969).

Descriptors: *Iowa, *Drainage, *Surface drainage, *Subsurface drainage, Legislation, Ditches, Tile drainage, Mine drainage, Obstruction to flow, Damages, Legal aspects, Levees, Railroads, Highways, Controlled drainage, Compensation, Local governments, Natural flow, Discharge (Water), Drains, Boundaries (Property).
Identifiers: Individual drainage rights.

Landowners desiring to construct any levee, open ditch, tile, or underground drain, for agricultural, mining, or improved drainage purposes across the lands of others or the right of way of a railroad or highway may file an application with the township clerk setting forth the description of the land and the specifications for such levee, ditch, or drain. The township trustees shall then conduct a hearing to determine the desirability of such system, the permissible specifications therefor, and the compensation to be paid by the applicants for property damages by reason of the construction. Where such construction is through railroad property, the railroad company may choose to construct such improvement. Any dispute as to the repair of a constructed drain shall be determined by the trustees. Any person obstructing such drain shall be liable to the owner of the drained lands for damages caused thereto. Landowners may drain their land in the general course of natural drainage by constructing or reconstructing, wholly upon their own land, open or covered drains, discharging the same in any natural watercourse or depression, and shall not be liable in damages therefor. (Marsee-Fla)
W69-09826

DRAINAGE AND LEVEE DISTRICTS WITH PUMPING STATIONS.

Iowa Code Ann, secs 461.1 to 461.24 (1949), as amended, (Supp 1969).

Descriptors: *Iowa, *Pumping plants, *Drainage systems, Drainage programs, Surface waters, Drainage engineering, Drainage practices, Chan-

neling, Controlled drainage, Pumps, Watersheds (Basins), Water conveyance, Legislation, Legal aspects, Levees, Regulation, Administrative agencies, Costs, Construction costs, Assessments.

In counties where a drainage district has been established, the Board of County Supervisors may establish and maintain pumping stations if these are necessary for proper drainage of the land comprising the district. The costs of construction and maintenance of a pumping station may be assessed against lands in the district which are thereby benefited. The county board may act to establish a station only upon petition by one-third of the affected landowners. The lands benefited by such a station will be determined by the board and by report of an engineer appointed by the board of supervisors. After the establishment of a drainage district and pumping plan, but before completion of the improvement, the board may resolve to establish such additional pumping stations as the engineer may recommend. The board must consider petitions by landowners for additional pumping stations. The board, upon receipt of the proper petition from the landowners, may act to divide a drainage district in which two or more pumping stations are operating. A county board may acquire lands for a channel running from overflowed lands to a settling basin if flooded conditions exist in its district, and if a basin has been provided. (Kelly-Fla)

FEDERAL FLOOD CONTROL COORDINATION.
Iowa Code Ann, secs 455.201 to 455.217 (1949), as amended, (Supp 1969).

Descriptors: *Flood control, *Iowa, *Drainage districts, *Administrative agencies, Coordination, Engineering estimates, Damages, Benefits, Conservation, Local governments, Financing, Legislation, Construction costs, Cost allocation, Appraisals, Assessments, Meanders, Streams, Levees, Federal government.

Whenever the United States government files a plan for improvements to a water district with the county auditor, the board of supervisors of the county has authority, after notice and hearing, to accept said plan and pay that portion of the expenses not paid by the federal government. No notice or hearing is necessary where the plan's cost does not exceed 25% of the total previous district expenditures. After the plan is filed, an engineer is appointed to examine the plan and report to the board. If the report is favorable and the board accepts the plan, then appraisers are appointed to determine damages and commissions are appointed to assess benefits derived. If the district is managed by a board of trustees, they will perform the functions of the board of supervisors. Any levee or drainage district may use, as a permanent easement, lands owned by the state upon permission from the appropriate state agency. (Darragh-Fla)
W69-09829

BRIDGES OVER NAVIGABLE RIVERS.
Ill Ann Stat ch 121, secs 192, 193a (Smith-Hurd 1960).

Descriptors: *Illinois, *Navigable rivers, *Bridges, *Bridge construction, Piers, Legislation, Abutments, State governments, Federal government, Political aspects, Administration, Interstate, Regulation, Boundaries (Property), Rivers, Navigation, Construction, Channels, Reinforcement, Interstate rivers, Mississippi River, Ohio River, Structures.
Identifiers: Illinois River, Congress, Pier protection.

The state assents to the construction of bridges across navigable rivers in the state and upon its boundaries whenever the Congress of the United States so authorizes. If any state bordering the Ohio or Mississippi Rivers refuses to grant these privileges for the construction of a bridge over the above mentioned rivers into that state, Illinois will not allow any bridge company from the other state to build a bridge into Illinois. Every person owning or managing a bridge over a navigable portion of the Illinois River shall construct, contiguous to the channel of the river, adequate pier protection for the piers of such bridge. Such construction must be adequate to meet navigation requirements existing at the time and expected during the future life of such piers. (Shevin-Fla)

MISSISSIPPI BRIDGES PURCHASED.

Iowa Code Ann sec 313.66 (Supp 1969).

Descriptors: *Iowa, *Bridges, *Mississippi River, Maintenance, Cities, Highways, Administrative agencies, Local governments, Legislation, Interstate, Interstate rivers.

The Highway Commission may purchase and maintain one half of any bridge over the Mississippi River which is in receivership and which connects a primary road in a city of the state to a corresponding road in an adjoining state. Payment not to exceed $100,000 will be paid from the primary road fund only after the purchase has been approved by the proper board of supervisors, city council and school board or boards and the adjoining state has agreed to purchase the other half of the bridge. (Darragh-Fla)
W69-09834

DRAINAGE.
Ill Ann Stat ch 42, secs 2-1 thru 2-11 (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Illinois, *Drains, *Drainage practices, *Surface drainage, Easements, Controlled drainage, Damages, Ditches, Structures, Levees, Construction, Maintenance, Legal aspects, Beneficial use, Legislation, Natural flow, Benefits.
Identifiers: Upland owners, Lowland owners.

Land may be drained in the general course of natural drainage by either open or covered drains. When such a drain is entirely on the land of the owner constructing the drain he is not liable for damages arising from such construction. A covered drain may be extended through the land of others under specified circumstances through the use of specified judicial procedure. The owner of a drain which is extended through the land of others may enter such land to maintain his drain, but is liable for damage he causes. The term 'drains and levees for mutual benefit' is defined and the mutual beneficiaries are given a perpetual easement on all lands concerned. The consent of all existing beneficiaries is required for legal connection to mutually beneficial drains and levees. (Keith-Fla)
W69-09835

WATER NAVIGATION REGULATIONS.

Iowa Code Ann secs 106.12-106.17 (Supp 1969).

Descriptors: *Iowa, *Boating regulations, *Administrative agencies, *Navigation, Legislation, Legal aspects, Boats, Navigable waters, Water skiing, Surf-boarding, Jurisdiction, Federal government, Local governments, State governments, Recreation.
Identifiers: Penalties (Criminal).

No person shall operate any vessel, or manipulate any water skis, surfboard or similar device in a careless, reckless, or negligent manner, nor operate such devices while intoxicated or under the influence of any narcotic, barbituate, or marijuana. Cans, bottles, and other rubbish shall not discarded in any public waters. No blue or flashi blue light may be used except on authorized em gency vessels. No vessel having over 6 horsepow shall be operated by a person under 12 years of a unless accompanied by a responsible person years of age or over. Fines and imprisonment a established for any person convicted of operatin vessel while intoxicated or under the influence drugs. Regulations are established for the use water skis and surfboards. The commission m authorize the holding of regattas, motorboat other boat races, marine parades, tournaments exhibitions on any waters of this state under the risdiction of the commission. The provisions of t section shall not exempt any person from co pliance with applicable federal law or regulatio When any local regulations conflict with any pro sion of this chapter, the local law will be inope tive. (Heckerling-Fla)

BENEFITED WATER DISTRICTS.

Iowa Code Ann secs 357.1-357.33 (1949), amended, (Supp 1969), sec 357.34 (Supp 1969)

Descriptors: *Water districts, *Local governmer *Benefits, *Iowa, Legislation, City planning, A sessments, Planning, Contract, Construction, Co pensation, Condemnation.

The board of supervisors of any county, upon pe tion for construction of a water district brought twenty five percent of the property holders in su proposed water district, may grant a hearing determine the advisability of such constructi The district may include all or part of any inc porated city with or without surrounding territo An engineer will be appointed to design the distri After approval of the plan by popular vote, bids be taken for construction of the district. The p ject will be paid for by assessments based u benefits derived. The district trustees are powered to contract to purchase water for the trict if the source of water is without the distric the source is within the district, they may drill water and reservoir it. Additional subdistricts private mains may be constructed. The board of pervisors may condemn needed property. (D ragh-Fla)

VAN DUYSE V FLEMING (NATUR DRAINAGE OVER ADJACENT LAND).
432 SW 2d 10-11 (Ark 1968).

Descriptors: *Arkansas, *Surface drainage, *T drainage, *Drainage effects, Dams, Levi Ditches, Judicial decisions, Natural flow doctri Obstruction to flow, Relative rights, Land tent Floods, Silts, Silting, Damages.
Identifiers: *Injunction, Natural drainage.

Appellant and appellee are adjacent landown Appellee maintains a dam on his property, wa from which drains onto appellant's land. In a pr suit appellant sought damages and an injunctio abate the maintenance of the pond. The trial co found that there was a natural drainage crossing appellant's land. The court ordered app lant to remove a levee he had constructed to struct the natural drainage. The trial court later dered appellant to construct a drainage ditch ar larger drain tile through the levee. In the pres action appellant sought another injunction damages caused by alleged silting. The chance denied appellant's requests and ordered him comply with the previous court order. T Supreme Court of Arkansas upheld the chan lor's decree on all points. (Harris-Fla)

SOLOMON V CONGLETON (RIGHT TO STRUCT NATURAL WATERCOURSES A

SURFACE DRAINAGE).

232 SW 2d 865-868 (Ark 1968).

Descriptors: *Arkansas, *Obstruction to flow, Natural streams, *Surface drainage, Beds, Banks, Land tenure, Natural flow doctrine, Relative rights, Judicial decisions, Levees, Floods, Surface water, Water discharge, Flow, Swamps, Bogs, Shallow water, Watercourses (Legal).
Identifiers: *Sloughs, Lower landowners, Injunction (Mandatory).

Defendant constructed levees which obstructed the flow of water through a slough emptying into a river. Plaintiff sought a mandatory injunction to require their removal. Since it is unlawful to obstruct a natural watercourse, but lawful for a lower landowner to fend off surface water, the question for the chancellor was whether the slough was a natural watercourse. The chancellor issued the mandatory injunction and the defendant appealed. The Supreme Court of Arkansas in affirming, held that plaintiff had a right to the continued unimpeded flow of any natural watercourse crossing his land. Therefore, defendant must maintain channels sufficient to accommodate such waters in ordinary conditions and reasonably expected flood conditions. The court defined a watercourse to be a stream flowing usually in a particular direction, though not necessarily continually. It must have beds and banks and generally discharge into some other body of water. It is thus something more than mere surface drainage. The chancellor's finding that the slough was a natural watercourse was from disputed facts and the supreme court was unwilling to disturb that finding. (Harris-Fla)

SACHS V CHIAT (DAMAGE FROM SURFACE WATER RUNOFF).

162 NW 2d 243-247 (Minn 1968).

Descriptors: *Minnesota, *Reasonable use, *Alteration of flow, *Surface runoff, Riddance (Legal aspects), Drainage, Water, Repulsion (Legal aspects), Surface waters, Land tenure, Surface drainage, Overland flow, Precipitation excess, Storm runoff, Land use, Legal aspects, Judicial decisions, Natural flow doctrine, Relative rights, Piles (Foundations), Pile driving, Damages, Civil law, Land use.
Identifiers: Injunctions (Prohibitory), Upper landowners, Lower landowners.

Plaintiff and defendant were adjacent land owners in a residential area. The concussion from pile driving during the construction of defendant's residence damaged plaintiff's residence. Surface water draining from defendant's higher land caused injury to plaintiff's land. Plaintiff sought recovery for damages and an injunction to prevent the continuance of drainage. From a verdict for defendant and denial of the injunction, plaintiff appealed. The court reversed on the issue of damages, holding that pile driving was an ultra-hazardous activity and that negligence did not have to be shown for liability to arise. However, a land owner is only liable for damage caused by the flow of surface water from his land if the natural flow is altered by an unreasonable use of the land. A jury could properly find defendant's use of his land reasonable under the circumstances. The injunction was properly denied because defendant had taken measures to avert the harmful flow except under abnormal conditions. (Helwig-Fla)

HAMPTON HARBOR AND BEACH EROSION CONTROL.

NH Rev Stat Ann secs 216-B:1 thru 216-B:6 (1964).

Descriptors: *New Hampshire, *Channel improvement, *Erosion control, *Harbors, Beaches, Erosion, Federal government, Legislation, Costs, Government finance, Shores, State governments, Construction, Construction costs, Contract administration, Administrative agencies, Navigation, Navigable waters, Beach erosion, Projects, United States, Legal aspect, Management.
Identifiers: Army Corps of Engineers, Federal-state cooperation, Federal projects.

The governor, with the advice of the council and upon a finding that federal funds will be available, is empowered to undertake in cooperation with the Army Corps of Engineers a project to improve navigation in Hampton Harbor and a project to restore damaged beach areas resulting from erosion on Hampton Beach. The governor and council are authorized to enter agreements with the federal government to secure federal funds, including an assurance that the state will hold the United States free from all damages arising out of said project. It is anticipated that the Corps of Engineers will supervise the project with such state supervision as necessary resting in the commissioner of public works and highways. Upon completion of the projects, the federal government shall assume maintenance of the harbor entrance channel and facilities. The management of the harbor improvement project shall be supervised by the New Hampshire Port Authority and the supervision of the beach project shall be by the division of parks. Construction contracts shall be administered by the commission of public works and highways. The commission shall cooperate with the Corps of Engineers in studies and construction, and shall provide the governor and council with information to implement this act. (Kahle-Fla)

WATERWAYS, DRAINAGE, FLOOD CONTROL, WATER POLLUTION AND WATER RESOURCES STUDY COMM'N.

Ill Ann Stat ch 19, secs 145.31-145.34 (Smith-Hurd Supp 1969).

Descriptors: *Illinois, *Drainage programs, *Flood control, *Water pollution control, Water resources, Administrative agencies, Feasibility studies, Legislation, State governments, Local governments, Cost analysis, Inter-agency cooperation, Planning, Administrative costs, Programs, Administration, Financing.

A nine member Waterways, Drainage, Flood Control, Water Pollution and Water Resources Study Commission is created consisting of members from the state Senate, state House of Representatives, and appointees of the governor. The members shall receive no compensation other than actual expenses. The commission shall study: state and municipal problems of waterways, drainage, flood control, water pollution and water resources; the feasibility of plans to promote interagency cooperation in regard to such matters; the costs of administering programs and the sources of revenue for such matters; the feasibility of state programs or grants-in-aid to local governments for such programs; and the need for revision of laws concerning such problems. The commission may request and receive any necessary data and reasonable assistance from state or local officials. The commission may receive gifts or grants from any federal, state, or private agency for the purpose of carrying out its duties. The commission shall report its findings and make recommendations for legislation it deems necessary each odd numbered year. (Kahle-Fla)

4B. Groundwater Management

CLOGGING IN SURFACE SPREADING OPERATIONS FOR ARTIFICIAL GROUNDWATER RECHARGE,
Agricultural Research Service, Fresno, Calif. Groundwater Recharge Field Station.
Jerold J. Behnke.
Water Resources Res, Vol 5, No 4, p 870-876, Aug 1969. 7 p, 5 fig, 2 tab, 11 ref.

Descriptors: *Water spreading, *Filtration, *Artificial recharge, *Permeability, Turbidity, Porous media, Particle size, Porosity, Suspended load.
Identifiers: Filter clogging.

Clogging is a complex phenomenon dependent upon many variables. For the conditions studied it is essentially a surface-sealing process. When turbid water contains a range of grain sizes, clogging is initiated by the deposition of a surface layer that is graded because of the gravitational segregation of heavier particles. Most of the clogging results from the straining of finer particles from the flowing water by the graded depositional layer. An equation was developed which predicts accumulated water quantity versus time relationships for several concentrations of a specific turbidity. Even coarse-grained porous media clogged at turbid water concentrations as low as 50 ppm. (Knapp-USGS)

HUMBOLDT RIVER STUDIES,
Nevada Univ., Reno. Desert Research Inst.
W. R. Larson, R. D. Winnergren, E. P. Zeizel, P. A. Domenico, and C. Case.
Nevada Center for Water Resources Research Project Report No 10, Jul 1968. 104 p, 13 fig, 9 tab, 38 ref, 7 append. OWRR Project A-010-NEV.

Descriptors: *River Basin development, *Surficial geology, Irrigation, Sediments, Wells (High yield), Recharge (Artificial), *Statistical technique, High flow.
Identifiers: *Humboldt River Basin.

The maximum beneficial use of the total water supply for irrigation in Humboldt River Basin requires that both surface water and groundwater be used. Successful integration of these supplies entails hydrogeologic, legal and economic considerations. In that the Humboldt River Basin sediments

are highly transmissive and, therefore, capable of producing high yield wells, the hydrogeologic problem was reduced to ascertaining the potential for recharge. This problem is analyzed by applying statistical techniques to high flows and to the relationship between recharge and surficial geology, and by field mapping. The legal problem centers around acquisition of rights to pump, anticipated interference with surface water rights, priorities, possibility of artificial recharge, and forfeiture due to nonuse during periods of sufficient water. The economic problem is complicated in that groundwater is to be used to supplement a stochastic surface water supply with a deterministic demand. Further, the nonconcurrence of the areas of major water use and the most productive aquifers involves costs that may preclude use of groundwater altogether. The economic problem is analyzed in terms of current net benefits of surface water and influence of supplemental pumping on these benefits. (Johnson-Univ of Nev)

Identifiers: *Logging (Forest), *Experimental watersheds.

Municipal watersheds are being subjected to increasing pressure for other uses. This paper presents a brief description and history of forest management on the 17,300-acre watershed owned by the city of Baltimore, Maryland. Water quality protection, timber production, and recreation are the three principal functions of the area. A knowledge of how these uses are successfully accommodated on one watershed should help managers in other areas.

Descriptors: *Soil properties, *Erosion, Erosion control, Slopes, Soil density, Infiltration, Rainfall-runoff relationships, Rainfall, pH, Soil chemical properties, Runoff, Soils, Soil science, Soil tests, Land use, Subsoil, Soil texture, Organic matter, *Agriculture, Bibliographies.
Identifiers: *Erosion index, Infiltration capacity.

The inherent erodibility of soil, a major factor in erosion prediction and land-use planning, is a complex property dependent on infiltration capacity and capacity to resist detachment and transport by rainfall and runoff. The relations of these capacities to soil physical and chemical properties were investigated in a 5-yr field, laboratory, and statistical study including 55 selected Corn Belt soils. Properties that contributed significantly to soil-loss variance included percentages of sand, silt, clay, and organic matter; pH, structure, and bulk density of plow layer and subsoil; steepness and concavity or convexity of slope; pore space filled by air; residual effects of sod crops; aggregation; parent material; and various interactions of these variables. An empirical equation was derived for calculating the erodibility factor K of the universal soil-loss equation for specific soils. Tests of the equation against soils of the older erosion-research stations, for which the erodibility factor is known, substantiated general applicability over a broad range of medium-textured soils. Channel flow, Fluid flow, River flow, Strea
Reynolds number, *Sediment transport, Hy
lics, Hydrology.
Identifiers: Channel beds.

The concentration of suspended sediment ne
bed of a channel is inversely proportional t
distance from the channel boundary. Further
the boundary in the open stream, the concentr
varies exponentially. This effect suggests that
channel flows with suspended sediment can
vided into an inner suspension region near th
and an outer suspension region in the free st
with different sediment transfer processes in
zones. Analyses were made of sediment conce
tion profiles from river measurements and la
tory flume experiments. Equations were derive
relative sediment concentration in both zones
thickness of the inner suspension zone corre
with the displacement boundary thickness
ratio of sediment boundary layer thickness to
flow depth correlates with Reynolds numbe
not with the ratio of shear velocity to
velocity. The sediment transfer ratio varies lin
with elevation above channel bottom in the
suspension zone and is constant in the outer

HYDROLOGIC RESEARCH FOR WATERS ENGINEERING,
Agricultural Research Service, Beltsville,
Hydrograph Lab.
H. N. Holtan.
J Hydrol, Vol 8, No 2, p 207-216, June 1969.
4 ref.

Descriptors: *Water resources development, *Water management (Applied), Planning, Rainfall-runoff relationships, Stochastic processes, Markov processes, Probability, Systems analysis, Meteorology, Hydrogeology, Hydraulics, Reviews, International hydrological decade.
Identifiers: Watershed engineering.

Watershed engineering is dynamically increasing its scope and vitality in order to integrate a complexity of interests in land and water resources. Agriculture, industry and urban interests vie for the choicest land areas, often with contrasting objectives that can be made compatible only through basin planning. Hopefully, the current effort of the International Hydrologic Decade will supply concepts and information helpful to the hydrologic phases of watershed engineering. This article is written to inspire objective thinking in the selection of watersheds for research and in the design of the research model. Both stochastic and deterministic approaches are needed but they require different types of research watersheds, and, most definitely, they require different research models. (Knapp-USGS)

SOIL CONSERVATION.

Iowa Code Ann secs 467A.1 to 467A.41 (Supp 1969).

Descriptors: *Iowa, *Soil conservation, *Erosion control, *Administrative agencies, Soil erosion, Legislation, Watershed management, Flood control, Soil management, Sediment control, Conservation, Preservation, State governments, Adjudication procedure, Legal aspects, Assessments, Taxes, Operating costs.

It is declared to be the policy of the Iowa legislature to provide: (1) for the restoration and conservation of the soil and soil resources of the state; (2) for the control and prevention of soil erosion; and (3) for the prevention of erosion, floodwater, and sediment damages. Such provisions shall serve to preserve natural resources, control floods, prevent impairment of dams and reservoirs, assist and maintain the navigability of rivers and harbors, preserve wildlife, protect the tax base, protect public lands, and promote the health, safety and public welfare. The state soil conservation committee is established, and its powers and duties are enumerated. Provisions for the creation of soil conservation districts and district commissioner offices are set forth as are the powers of the districts and commissioners. Subdistricts for the purpose of carrying out watershed protection and flood control programs are authorized and procedure for their formation outlined. Powers of the subdistricts include the power to levy a special annual tax and to tax for watershed protection and flood prevention, to condemn land and interests, and to make assessments for improvements. 05. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification of Pollutants

PESTICIDES IN SELECTED WESTERN STREAMS-A PROGRESS REPORT,
Geological Survey, Austin, Tex.
Douglas B. Manigold, and Jean A. Schulze.
Pesticides Monit J, Vol 3, No 2, p 124-135, Sept 1969. 12 p, 1 fig, 3 tab, 8 ref.

Descriptors: *Pesticide residues, *Surface waters, *Sampling, *Surveys, *Data collections, Monitoring, Chemical analysis, Gas chromatography.
Identifiers: Pesticide monitoring.

Data are presented from the U.S. Geological Survey program for monitoring pesticides in the streams of the Western United States in the period October 1966-September 1968. The original network of 11 monthly sampling stations, established in October 1965, was increased to 20 in October 1967. Compounds determined include the common chlorinated insecticides and herbicides. All of these pesticides were detected at one time or another; DDT was the most frequently occurring insecticide, and 2,4-D the most common herbicide. The amounts observed were small; the maximum concentrations of DDT and 2,4-D were 0.12 and 0.35 microgram/liter, respectively. Concentrations were highest in the water samples that contained appreciable amounts of suspended sediment. Data obtained thus far in the operation of the network have been insufficient to show real correlation with discharge or season of the year. (Knapp-USGS)

THE ANNUAL AND DIURNAL VARIATION IN THE VERTICAL DISTRIBUTION OF ACID-SOLUBLE FERROUS AND TOTAL IRON IN A SMALL DIMICTIC LAKE,
Atomic Energy of Canada Ltd., Chalk River (Ontario). Biology and Health Physics Div.
J. W. McMahon.
Limnol and Oceanogr, Vol 14, No 3, p 357-367, May 1969. 11 p, 8 fig, 24 ref.

Descriptors: *Lakes, *Stratification, *Iron, *Iron compounds, *Diurnal distribution, Acidic water, Photoactivation, Metabolism, Microorganisms, Analytical techniques, Seasonal, Dissolved oxygen, Spectrophotometry, Sampling, Biological properties, Water temperature, Water circulation, Iced lakes.
Identifiers: Dimictic Lakes, Ferrous ion concentrations.

Variation in the vertical distribution of dissolved iron in Upper Bass Lake, Ontario from March 1966 to February 1967 was measured photometrically using the ferrous specific reagent bathophenanthroline. Acid-soluble ferrous iron was presented throughout all strata with the concentration flucuating in a definite annual pattern. Values of ferrous ion change hourly and follow a diurnal pattern. The concentration of ferrous ion in lake water may be controlled by photochemical reactions and, perhaps, also by metabolic activity of microorganisms. (Gabriel-USGS)
W69-09677

USE OF ENDOCOMMENSAL MOLLUSCAN CILIATED PROTOZOA AS INDICATORS OF WATER QUALITY AND POLLUTION IN ILLINOIS WATERS,
Illinois Univ., Urbana. Water Resources Center.
Eugene B. Small, and Gregory A. Antipa.
Research Report No 24, Water Resources Center, University of Illinois, July 1969. 27 p, 9 fig, 1 table, 31 ref. OWRR Project A-015-Ill.

Descriptors: *Indicators, *Protozoa, Infection, *Mollusks, Water pollution effects, Water quality.
Identifiers: Endocommensal molluscan ciliated protozoa.

Fifteen species of unionid bivalves from seventeen localities in Central Illinois were carefully examined for ciliate protozoan infections. Many ciliates appeared occasionally, but the thigmotrich ciliates Conchophthirus and Heterocinetopsis unionidarum appeared abundantly and consistently. Although Conchophthirus and Heterocinetopsis were the only thigmotrichs uncovered in this study, the isolation of Heterocinetopsis suggests that other thigotrich ciliates may also be found in Illinois. The ciliates Conchophthirus and Heterocinetopsis were tested for their ability to react as very delicate indicators of water quality by planting infected bivalves in areas of known pollution. At intervals after planting, individuals were recovered and carefully examined for the relative abundance of Conchophthirus and Heterocinetopsis. The preliminary results suggest that Heterocinetopsis may be the most critical indicator of biological pollution currently available for Illinois waters. (Betchart-Univ of Ill)

BIOASSAYS FOR MICROCHEMICAL ENVIRONMENTAL CONTAMINANTS,
Foundation of Environmental Biology, Berkeley, Calif.
Richard E. Warner.
Bulletin World Health Organization, Vol 36, p 181-207, 1967. 6 fig, 221 ref.

Descriptors: *Bioassay, *Water pollution sources, Water quality, Water pollution effects, Bibliographies, Bioindicators, Lethal limits, Toxicity, Behavior, Physiological ecology, Environmental effects, Biochemistry, Growth rates.
Identifiers: *Microchemical contaminants, *Environmental contaminants, Histochemical effects, Embryological effects, Regeneration effects, Sensory physiology.

Bioassay procedures, as adapted to the study of actual and potential contaminants of the environment, are reviewed in considerable detail. The methods are grouped according to the nature of the response of the indicator organisms. The following groupings are used: (1) acute response (usually death), (2) behavioural change, (3) physiological change, (4) biochemical and histochemical change, (5) ecological change, (6) embryological and regenerational change, (7) growth change, (8) histological change, and (9) changes perceived by humans or aquatic organisms. Consideration is given to the selection of appropriate tests, the problem of sequential concentration, and the establishment of response syndromes. It is concluded that the essential step of standardizing bioassay techniques must be taken if significant progress is to be made. (Uttormark-Wis)

CHEMICAL WATER QUALITY SURVEY OF THE SURFACE WATERS OF THE BOIS BRULE RIVER AND ITS WATERSHED, WISCONSIN, TRIBUTARY TO LAKE SUPERIOR,
Wisconsin State Univ., Superior.
Donald A. Bahnick, Joseph W. Horton, and R. K. Roubal.
Univ of Wisconsin, Water Resources Center, Report, 1969. 20 p. OWRR Proj A-023-Wis.

Descriptors: *Water quality, *Surface waters, *Wisconsin, Chemical oxygen demand, Dissolved oxygen, River basins, Hydrogen ion concentration, Suspended load, Color, Electrical conductance.
Identifiers: *Bois Brule River (Wis), Northwestern Wisconsin.

A study of certain chemical parameters for the Bois Brule River, Wisconsin Watershed is presented. This study was undertaken in order to establish 'wild river' conditions for streams in the northwestern Wisconsin area. Measurements of nitrogen, phosphorus, copper, dissolved oxygen, chemical oxygen demand, electrical conductivity, pH, total solids, and water color were made during a two month period (1968) at 52 stations along the river and its tributaries. The results of this study are correlated with station locations and rainfall whenever possible. (Bahnick-Wis State Univ)

CONCEPTS OF FECAL STREPTOCOCCI IN STREAM POLLUTION,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio. Cincinnati Water Research Lab.
Edwin E. Geldreich, and Bernard A. Kenner.
J Water Pollut Contr Federation, Vol 41, No 8, Part 2, p R336-R352, Aug 1969. 17 p, 3 fig, 6 tab, 37 ref, 1 append.

Descriptors: *Streptococcus, *Coliforms, *Bioindicators, *Water pollution sources, Aquatic bacteria, Runoff, Storm runoff, Water pollution, Surveys, Sampling, Water pollution effects.
Identifiers: *Fecal streptococci, Bacterial survival times.

Results of an intensive study on the occurrence and strain distribution for 12,536 fecal streptococcus strains found in warm-blooded animal feces and numerous water sources from a wide geographical area reveal several new factors that must be understood for a proper interpretation of the sanitary significance of this bacterial group in water pollution studies. The ubiquity of Streptococcus faecalis var. liquifaciens in the water environment and the occasional occurrence of an atypical S. faecalis associated with vegetation shows the need for including the fecal coliform examination in recreational water quality measurements. Applications of the fecal streptococcus indicator system in stream pollution are the development of fecal coliform to fecal streptoccus ratios that will further define possible sources of the fecal discharge into the stream; and the detection of the S. bovis and S. equinus subgroup which was not found in human feces and may be considered a specific indicator of non-human animal pollution. LINDANE DIFFUSION IN SOILS:[1]. THEORETICAL CONSIDERATIONS AND MECHANISM OF MOVEMENT,
California Univ., Riverside. Dept. of Soils and Plant Nutrition; and Agricultural Research Service, Riverside, Calif.
Wilfried Ehlers, J. Letey, W. F. Spencer, and W. J. Farmer.
Soil Sci Soc Amer Proc, Vol 33, No 4, p 501-504, July-Aug 1969. 4 p, 4 fig, 10 ref.

Descriptors: *Diffusion, *Insecticides, *Soils, *Pesticide kinetics, Soil water movement, Path of pollutants, Mass transfer, Thermodynamic behavior, Chlorinated hydrocarbon pesticides, Saturated flow, Unsaturated flow.
Identifiers: *Lindane.

Equations are developed to describe the combined vapor and 'nonvapor' phase diffusion of a volatile insecticide in soils and compared with the diffusion of lindane in a Gila silt loam in a transient state system. The quantity of diffused lindane appears to increase linearly with increased lindane concentration in the treated soil up to about 20 ppm but deviates from linearity at higher concentrations. The diffusion coefficient of lindane is independent of time until 22 ppm of the initial 80 ppm lindane concentration in the treated soil have diffused into the formerly untreated soil. The diffusion rate then decreases rapidly. The dependency of the diffusion coefficient on concentration and time may be explained by the fact that lindane will reach maximal vapor density in the range of 20 to 30 ppm. After these concentrations are built up in the initially untreated half-cells by diffusion, vapor diffusion approaches zero and all the diffusion is in the 'nonvapor' phase. At a 10% soil water content, 50% of the lindane diffuses in the vapor phase and 50% in the 'nonvapor' phase. At near saturation, total diffusion is in the 'nonvapor' phase. Lindane diffusion in soils can easily change from 'nonvapor' to vapor phase and back to 'nonvapor' phase. (Knapp-USGS)
W69-09477

LINDANE DIFFUSION IN SOILS:[2]. WATER CONTENT, BULK DENSITY, AND TEMPERATURE EFFECTS,
California Univ., Riverside. Dept. of Soils and Plant Nutrition; and Agricultural Research Service, Riverside, Calif.
Wilfried Ehlers, W. J. Farmer, W. F. Spencer, and J. Letey.
Soil Sci Soc Amer Proc, Vol 33, No 4, p 505-508, July-Aug 1969. 4 p, 3 fig, 4 tab, 9 ref. USDA Contract 12-14-100-9016 (41).

Descriptors: *Diffusion, *Adsorption, *Insecticides, *Soils, *Pesticide kinetics, Soil water movement, Path of pollutants, Mass transfer, Thermodynamic behavior, Chlorinated hydrocarbon pesticides, Saturated flow, Unsaturated flow.
Identifiers: *Lindane.

The diffusion of lindane in Gila silt loam is strongly influenced by soil water content, bulk density, and temperature. The diffusion coefficient is nearly zero in soil of 1% water content. With an increase in .3% water content, which is equivalent to 2 layers of water between the montmorillonite clay plates, water is able to displace the lindane the adsorbing surface so that the diffusion c cient becomes maximal. A small additiona crease in water content reduces the diffusion ficient to about one-half of the maximal value. value then remains constant with increasing content up to saturation. Decreasing bulk de or increasing temperature raises the diffusion ficient. The influence of bulk density and tem ture on diffusion is in good agreement theoretical calculations. (Knapp-USGS)
W69-09478

VAPOR DENSITY OF SOIL-APPLIED D DRIN AS RELATED TO SOIL-WATER C TENT, TEMPERATURE, AND DIELDRIN C CENTRATION,
California Univ., Riverside. Dept. of Soils and Nutrition; and Agricultural Research Se Riverside, Calif.
W. F. Spencer, M. M. Cliath, and W. J. Farmer
Soil Sci Soc Amer Proc, Vol 33, No 4, p 509 July-Aug 1969. 3 p, 4 fig, 9 ref.

Descriptors: *Dieldrin, *Vapor pressure, moisture, *Pesticide kinetics, Drying, Evapora Water loss, Volatility, Pesticide residues, physics, Soil chemistry.
Identifiers: Vapor density (Pesticides), HEOD

Vapor densities of dieldrin, which consists cipally of HEOD or hexachloroepoxyoctahyd do, exo-dimethanonaphthalene in dieldrin-soil tures increased with temperature and dieldrin centration but were not affected by soil-water tent until the water content decreased below equivalent of one molecular layer of water. densities dropped to very low values when water content fell below this level, but incre again as water was added to the dry soil, indic that the drying effect is reversible. When more a monomolecular layer of water was present soil, vapor density increased, with increasing concentration until a saturation vapor de equal to that of HEOD without soil was reach approximately 25 ppm HEOD. This implies surface applications of dieldrin and probably similar chlorinated hydrocarbon insecticides volatilize as rapidly from mineral soils as fro pure materials until the concentration at the face fails to relatively low levels. Loss of wa not required for significant rates of volatilizati occur from soils or other surfaces on which can successfully compete for adsorption sites napp-USGS)

OXYGEN UPTAKE RATES OF BENT DEPOSITS ON THE UPPER PASSAIC RIVE
Rutgers - The State Univ., New Brunswick, N.J
O. M. Donovan, and J. V. Hunter.
Paper presented at ASME/AIChE Water Poll Conference, June 1969. Publ by Water Reso Research Institution, Rutgers University, 196 p, 5 tab, 4 fig, 17 ref. FWPCA Contract 1 DUP.

Descriptors: *Benthos, *Water pollu *Biochemical oxygen demand, Oxygen deman
Identifiers: *Oxygen demand, Benthal, Be respirometer, Stream bottom, Oxygen balance ygen sink.

An in situ benthal respirometer was utilize determine benthal oxygen demands on the Pa River near Little Falls, New Jersey. Diff deposits on the stream were examined. Thes hibited demands ranging from 1.13 g/m2-da 3.79 (2)-day, with an average demand of g/m2-day. These demands were then exan from the viewpoint of their effects upon the ox stream oxygen balance. It was found that benthic demand upon the supernatant ranged from 0.261 mg/1-day at a flow rate o cfs to 0.120 mf/1-day at flow rate of 140 These data are presented in tabular and gr forms in subsequent sections of this paper. EFFECT OF VARIOUS FACTORS ON MOVEMENT OF NITRATE NITROGEN IN SOIL PROFILES AND ON TRANSFORMATIONS OF SOIL NITROGEN,
Wisconsin Univ., Madison.
R. J. Olsen.
Univ of Wisconsin, Water Resources Center, Report 1969. 79 p. OWRR B-004-Wis.

Descriptors: *Nitrification, *Soil nitrogen, *Public health, *Soil leaching, Groundwater, Soil profiles, Water table, Surface runoff, Farm wastes, Aerobic conditions, Incubation.
Identifiers: *Lake eutrophication, *Soil phosphorus, Alfalfa-bromegrass, Spring thaws, Fertilizer-nitrogen.

There is increasing evidence that agriculture is contributing to the increase in nitrate-nitrogen in streams, lakes, and domestic water supplies. High amounts of nitrate-nitrogen in water are a health hazard and contribute to lake eutrophication. Methods by which nitrogen may enter the water from agricultural sources include the leaching of nitrate-nitrogen through the soil profile to the water table and surface runoff, especially during spring thaws from manure applied to frozen soil during the winter. The data obtained from field experiments indicate that pollution of groundwater with nitrate-nitrogen can be limited by avoiding excessive rates of fertilizer nitrogen; providing a crop cover on the soil during the growing season; use of hay crops, such as alfalfa-bromegrass, in rotation with corn or other crops receiving fertilizer nitrogen; and not permitting unprotected manure to accumulate during the time of year when leaching can occur. Recovery of fertilizer nitrogen by three successive corn crops and as soil inorganic nitrogen following the last crop ranged from 72 to 88 percent. The average concentration of nitrate-nitrogen in the soil solution at the lowest profile depth sampled ranged from 14 ppm for virgin soils to 21 ppm for manure contaminated soils and to 33 ppm for cultivated soils. Rate of nitrification was directly related to the rate of manure application, presence of aerobic conditions, period of incubation, and soil phosphorus. The average recovery of nitrogen by chemical analysis of the soil receiving the higher manure rates after 37 weeks of incubation ranged from 24% for anaerobic conditions to 73 to 80 percent for the aerobic conditions. These data suggest that where animal manure is not to be used as a fertilizer, lagooning of the manure under anaerobic conditions may be an effective method of disposal with a minimum risk of water pollution. CHEMICAL REACTOR THEORY APPLIED TO MODELING THE DYNAMICS OF A CONTROL SYSTEM FOR WATER QUALITY OF A RIVER; PHASE I--A FEASIBILITY STUDY,
Maine Univ., Orono.
Edward G. Bobalek, Kenneth I. Mumme, and Ronald A. Lewis.
Proj Completion Rept, Maine Water Resources Center, Jul 1967. 39 p, Stab, 8 fig, 39 ref, 2 append. OWRR Proj B-001-ME.

Descriptors: *Computer models, Mixing, Waste dilution, *Control systems.
Identifiers: *Penobscot River Estuary, Dynamic system, Residence times.

This study was aimed to provide an exploratory appraisal of the feasibility of conducting an extensive experimental probing of a selected river system. Such experiments would have the ultimate goal of providing an accurate and workable model of one typical system in the State of Maine. Such a model would be used to implement an overall control scheme which can provide a basis for engineering decisions on regulating waste discharges into the river under conditions which do not overload the capability of the river to purge itself so as to restore water qualities affected by pollution loading. The Penobscot River estuary was selected as representative of conditions existing in the state with respect to water pollution. Existing models are inadequate for several reasons in analysing this type of dynamic estuary system. Feasibility of alternative approaches was explored by using computer simulations which attempted to predict the chemical reactor performance of the river assuming reasonable values of input variables.
W69-09731

CHEMICAL REACTOR THEORY APPLIED TO MODELING THE DYNAMICS OF A CONTROL SYSTEM FOR WATER QUALITY OF A RIVER; PHASE II--STUDY OF A RIVER SYSTEM AS A CHEMICAL REACTOR,
Maine Univ., Orono.
Edward G. Bobalek.
Proj Completion Rept, Me Water Resour Center, Aug 1969. 21 p, 5 fig. OWRR Proj B-003-ME.

Descriptors: *Computer models, Mixing, Waste dilution, *Control systems.
Identifiers: *Penobscot River Estuary, Dynamic system, Residence times.

Phase II (OWRR: B-003-ME), which extends the study of Phase I (OWRR: B-001-ME), projects the modelling of a river system as a tubular chemical reactor which can purge itself of oxidizable organics if scheduling of pollution inputs from known sources is guided by a feed-forward control scheme which responds to continuous monitoring of the chemical kinetics profile of the river system. The data requirements of the tentative river model proposed in Phase I has served its primary objective in guiding design, construction and performance testing under real and simulated service conditions of an instrumental, hardware system for continuous acquisition of data on salinity, temperature and oxygen content with depths at variable sampling sites. Although this first model was the basis for establishing requirements for river analysis, further developments of the pollution abatement goals are no longer dependent on adequacy of this first approximation to modelling. Comprehensive control schemes have been developed which are applicable to any adequate river model which can evolve from a history of data acquisition. At the conclusion of Phase II, the progress achieved is (1) Application of control theory, supported by software development, to make possible testing and validation of any tentative river model as a basis for a feed-forward control scheme. (2) Placement of four variants of pilot models of hardware systems into service for long-term performance evaluation in continuous acquisition, transmission, storage and processing of data which define the down-stream reaction potential of the river. Phase III (OWRR: B-005-ME), to validate the technical feasibility of the control schemes and to generate and appraise adequacy of improved river models is now continuing in the 25-mile tidal reach of the Penobscot River between the Bangor dam and the throat of Penobscot Bay at Bucksport, Maine.

WILL THE USE OF 2,4,5-T TO CONTROL STREAMSIDE VEGETATION CONTAMINATE PUBLIC WATER SUPPLIES,
Forest Service (USDA), Upper Darby, Pa. Northeastern Forest Experiment Station; Pennsylvania State Univ., University Park, Pa.; and Amchem Products, Inc., Ambler, Pa.
Irvin C. Reigner, William E. Sopper, and Roy R. Johnson.
Journal of Forestry, Vol 66, No 12, p 914-918, December 1968.

Descriptors: *Watershed management, *2-4-5-T, *Herbicides, *Riparian plants, Water yield improvement, Water supply, Organoleptic properties, Odor, Taste, Domestic water, Water quality, Brush control, Phenolic pesticides, New Jersey, Pennsylvania.

Riparian vegetation along two small headwater streams in Pennsylvania and New Jersey was treated with 2,4,5-T. Water samples were collected immediately after treatment and periodically thereafter for three weeks. Odor tests were used to determine the degree of contamination. Results indicated that only slight contamination occurred within the treated sections of streams immediately after treatment and in two instances after the first large storm. No contamination was detected downstream. Vegetation analysis one year after treatment indicated that the ester formulation had completely killed 70 to 81 percent of the stems and that the emulsifiable acid had killed 58 to 78 percent. Results of this study provide additional evidence that phenoxy herbicide, if applied with normal precautions, can be used on municipal watersheds without creating any water contamination.

POLLUTION OF WATER FROM AGRICULTURAL SOURCES,
Agricultural Research Service, Beltsville, Md. Soil and Water Conservation Research Div.
Lloyd L. Harrold.
The Ohio Engineer, Vol 29, No 4, p 10, Apr 1969. 16 p, 3 ref.

Descriptors: *Water pollution, *Agricultural chemicals, *Fertilizer, *Animal waste, *Water pollution sources, Leaching, Streamflow, Erosion.
Identifiers: *Farm chemicals, *Food production, Automatic sampler.

USA became the world's foremost food quality and quantity producer by use of farm fertilizer and other chemicals. Phosphate fertilizer and dieldrin pesticide attach to soil and do not dissolve readily in runoff water. They become a significant part of the pollution of water bodies only as soil is eroded by runoff water. Nitrate fertilizer polluts surface and subsurface water bodies where excessive amounts are applied and under high rates of rain and irrigation. It is water soluble. Beef cattle feedlots of over 70,000 head in one unit raised the nitrate content of the soil 20 feet deep to a maximum of 5,000 pounds per acre. Research is defining the involvement of agriculture in the pollution problem by determining the fate of agri-chemicals applied on farm lands and the effects of animal wastes. It is also developing cropping systems and other means for stabilizing pollutants from agricultural operations.

5C. Effects of Pollution

POLLUTION AND EUTROPHICATION PROBLEMS OF GREAT SOUTH BAY, LONG ISLAND, NEW YORK,
New York State Dept. of Conservation, Ronkonkoma.
Jack Foehrenbach.
J Water Pollut Contr Federation, Vol 41, No 8, Part 1, p 1456-1466, Aug 1969. 11 p, 4 fig, 1 tab, 16 ref.

Descriptors: *Eutrophication, *Bays, *Farm wastes, Poultry, Water pollution sources, Water pollution effects, Dissolved oxygen, Oxygen demand, Streamflow, Sport fishing, Commercial fishing, Recreation, Ecology, Economics, Fisheries, Pesticides, Waste water disposal.
Identifiers: *Great South Bay, Long Island (NY).

Great South Bay is located midway between New York City and Montauk Point. Each year sport fisheries gross $4,539,000. In addition, 53,400 lb of finfish ($12,000) and 4,792,000 lb of shellfish ($4,250,000) are harvested. Because of poor recirculation and small inflow of tidal waters, the creek flows of 24 million cu ft/day and groundwater flows of 28 million cu ft/day are helping to increase the nutrient content of the 92-sq mile bay, much of which is less than 8 ft deep. Although the bay has a large assimilative capacity for some forms of pollution, it is reaching a point where additional loads will affect adversely its ecology, economic, and recreational value. (Knapp-USGS)

PHOTOSYNTHETIC OXYGEN PRODUCTION IN A POLLUTED TROPICAL ESTUARY,
Asian Inst. of Tech., Bangkok (Thailand). Dept. of Environmental Engineering.
M. B. Pescod.
J Water Pollut Contr Federation, Vol 41, No 8, Part 2, p R309-R321, Aug 1969. 13 p, 11 fig, 3 tab, 11 ref. Proj No 34/3.

Descriptors: *Photosynthetic oxygen, *Reaeration, *Tropical regions, *Estuaries, *Water pollution effects, Turbidity, Oxygen demand, Nutrients, Photosynthesis, Oxygen sag, Solar radiation, Plankton, Phytoplankton, Productivity.
Identifiers: *Thailand, *Chao Phya River, Tropical estuaries.

Interference with light transmission by turbidity severely restricts phot osynthetic oxygenation in the Chao Phya River estuary in Thailand. Light and dark bottle studies indicated that oxygen production by phytoplankton was normally from 0.5 to 1.3 mg/l/day at the river surface and fell off to 0 at a depth of 1.0 to 1.5 m. Gross photosynthetic oxygen production at a heavily polluted section of the river ranged from 0.20 to 0.78 g/day/sq m, which supplied only 1.25 to 4.6% of the oxygen demand. An average rate of photosynthetic oxygen production of more than 0.014 mg/l/day should not be assumed in oxygen balance calculations for alluvial tropical rivers. (Knapp-USGS)

EFFECT OF ENVIRONMENTAL FACTORS ON BENTHAL OXYGEN UPTAKE,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering and Dow Chemical Co., Midland, Mich. Waste Treatment Div.
Archie J. McDonnell, and S. Douglas Hall.
Res supported by funds from OWRR, Dept of Interior. J Water Pollut Contr Federation, Vol 41, No 8, Part 2, p R353-R363, Aug 1969. 11 p, 7 fig, 5 tab, 20 ref. OWRR Contract 14-01-001-983.

Descriptors: *Oxygen demand, *Benthic fauna, *Benthic flora, *Decomposing organic matter, *Respiration, Biodegradation, Eutrophication, Water pollution effects, Aquatic microorganisms, Oxygen requirements, Sedimentation, Water temperature, Oxygen sag, Water quality.
Identifiers: Oxygen uptake.

The study was conducted to define the effects of oxygen concentration, temperature, and biological community on the oxygen demand of benthal deposits sampled from a mildly polluted eutrophic stream. Six-inch diam (15.2-cm) plastic cylinders were filled with benthal material from 2-, 12-, 15-, and 25-cm depths and mixed constantly in a dark environment. Results show that oxygen uptake varied according to oxygen concentration. Uptake was independent of sample depth--microbial concentration accounted for 45- to 48-percent respiration and invertebrate respiration, 52-55%. Uptake rates varied from 0.0001 to 0.0005. A two-fold biological rate increase was noted with a 10 C temperature rise. (Knapp-USGS)
W69-09457

EFFECT OF SLUDGE DEPTH ON OXYGEN UPTAKE OF A BENTHAL SYSTEM,
Perkins (Dana F.) and Sons, Inc., Reading, Mass.; and Tufts Univ., Medford, Mass.
Robert I. Davison, and N. Bruce Hanes.
Water and Sewage Works, Vol 116, No 8, p 301-306, Aug 1969. 6 p, 10 fig, 4 tab, 14 ref. Grant No 5T1-WP-40-05 (FWPCA).

Descriptors: *Oxygen demand, *Sludge, *Streams, *Water pollution effects, Biochemical oxygen demand, Biodegradation.
Identifiers: Sludge depth-oxygen demand relations.

A laboratory study was made of the effect of sludge depth on the oxidation rate of a benthal sludge deposit. The depths of sludge studied were 1.6, 15.2, and 30.5 cm in reactors each of which consisted of an annular chamber between 7 inch outside diameter and 8 3/4 inch inside diameter plexiglas cylinders, a magnetic stirrer, a thermistor, and an oxygen probe. Temperatures were controlled by running the experiments in a walk-in incubator. Experimental data are tabulated and shown graphically. Deeper sludge deposits exert a significantly greater oxygen uptake than shallower deposits. After consolidation of a sludge deposit, oxygen uptake is independent of depth. In a stream deposit, if the sludge is not agitated by stream turbulence or bubbling, depth and oxygen uptake are probably independent. (Knapp-USGS)

AGRICULTURE'S CONTRIBUTION TO THE FERTILIZATION OF CANAL LAKE,
Guelph Univ. (Ontario). Dept. of Soil Science.
F. R. Campbell, and L. R. Webber.
J Soil and Water Conserv, Vol 24, No 4, p 139-141, Aug 1969. 3 p, 2 fig, 2 tab, 9 ref.

Descriptors: *Eutrophication, *Nutrients, *Water pollution sources, *Agriculture, Nitrogen, Phosphorus, Fertilizers, Runoff, Farm wastes, Productivity, Aquatic plants.
Identifiers: *Canal Lake (Ontario).

Water quality, weed growth, and nutrient loadings of Canal Lake, Ontario were studied between May and November 1968. Relatively little nitrogen and phosphorus are contributed by the area's low-level agriculture. Precipitation contributes more nitrogen than streams. Agriculture contributes about 0.15 lb/acre, about a twentieth of the yield from an equivalent nonfertilized area. Most nitrogen probably comes from lake sediments, plants, and fixation of nitrogen in the lake. About 84% of the phosphorus probably originates in a lake upstream of Canal Lake. The agricultural yield is only about 63 lb from 30,000 acres. These contributions, of nutrients are negligible considering the total nutrients in the lake, the nutrient load of the streams and other sources of nutrients. (Knapp-USGS)

THE STRONTIUM AND CALCIUM RELATIONSHIPS IN CLINCH AND TENNESSEE RIVER MOLLUSKS,
Oak Ridge National Lab., Tenn. Radiation Ecology Section.
D. J. Nelson.
Proc 1st Nat Symp on Radioecology, Colorado State Univ, Fort Collins, Sept 10-15, 1961. Radioecology, Reinhold Pub Corp, NY and Amer Inst of Biological Sciences, Wash, DC, Schultz, Vincent and Klement Jr, Alfred W (eds), p 203-211, 1963. 1 fig, 8 tab, 19 ref.

Descriptors: *Strontium radioisotopes, *Calcium, *Mollusks, *Tennessee River, Clams, Growth rates, Sampling, Radioactivity, Stable isotopes, Ecosystems, Tracers, Bioindicators, Age, Flame photometry, Spectrophotometry, Fallout, Tennessee.
Identifiers: *Clinch River (Tenn), *Oak Ridge National Laboratory (Tenn), Shells, Species differences, Surface, Specific activity, Sphaeriidae, Physidae, Anodonta corpulenta, Quadrula pustulosa, Elliptio dilatatus, Elliptio crassidens, Pleurobema cordatum, Fusconaia subrotunda, Megalonaias gigantea, Actinonaias carinata gibba, Ligumea recta latissima, Lampsilis ovata, Dromus dromas, Quadrule metanevra, Amblema costata, Cyclonaias tuberculata, Plagiola lineolata, Proptera alata.

Shells of 16 species of clams were analyzed for calcium, strontium, and strontium-90 to determine content of these elements and strontium isotope as functions of species and location, and feasibility of their use as biological indicators of strontium-90. Calcium content was about 40% of ash weight; average strontium contents ranged from 156 to 382 micrograms per gram. Differing contents are due to inherent differences between species rather than to environmental ratios of strontium to calcium. Strontium content of clam shells increases with their growth rate and with reduced ratio of surface to volume. These factors do not explain strontium content of all species. Inherent species differences may be related to nonhomogeneous distribution of strontium within shells. Low-level releases of strontium-90 by Oak Ridge National Laboratory were used as tracers to determine behavior of strontium-90. On basis of dilution of Clinch River waters by the Tennessee, observed atomic ratios of strontium-90 to stable strontium agreed well with those expected in shells. This agreement suggests that clams may be useful samplers of strontium-90, and that strontium-90 released in Clinch River is in equilibrium with living and non-living components of the river system. NATURAL RADIOACTIVITY IN THE FOOD WEB OF THE BANDED SCULPIN COTTUS CAROLINAE (GILL),
Louisville Univ., Ky. Dept. of Biology.
W. L. Minckley, J. E. Craddock, and L. A. Krumholz.
Proc 1st Nat Symp on Radioecology, Colo State Univ, Fort Collins, Sept 10-15, 1961. Radioecology, 1963, Reinhold Pub Corp, NY and Amer Inst of Biological Sciences, Wash DC, Schultz, Vincent and Klement Jr, Alfred W (Eds) p229-236. 8 fig, 4 tab, 13 ref.

Descriptors: *Sculpins, *Radioactivity, *Food webs, Kentucky, Life history studies, Gamma rays, Spectrometers, Cyanophyta, Uranium radioisotopes, Strontium radioisotopes, Cesium, Fallout, Silts, Detritus, Bottom sediments, Chutes, Eddies, Habitats, Crayfish, Growth stages, Diatoms, Algae, Metabolism, Isopods, Amphipoda, Fish, Growth rates.
Identifiers: *Cottus carolinae, Mead County (Ky), Thorium-232, Bismuth-214, Actinium-228, Swift riffles, Zirconium-95, Niobium-95, Ruthenium-106, Rhodium-106, Cerium-144, Beta radioactivity, Goniobasis, Decapoda, Plecoptera, Ephemeroptera, Tipulidae, Chironomidae, Half-life.

Consideration of life history and radioecology of banded sculpin (Cottus carolinae) reveals that most radioactivity results from natural decay; some, from fallout. Biota of the ecosystem accumulate measurable amounts. In the food web of Cottus carolinae, radioactivity concentrates at the producer level, with decreased amounts at higher trophic levels involving animals. Animals, fed mostly on diatoms and blue-green algae, generally contained the most radioactivity. Vertebrates, and larger invertebrates contained radioactivity with levels varying according to size of individual animal. Smaller animals contained more radioactive materials per unit weight than larger ones. Actual metabolic changes seem to be as important in determining amount of retention and accumulation of radiomaterials as are amounts of the radiomaterials ingested. Similarly, cumulative amounts of radioactivity taken in as food, compared with ever-increasing body burden, allow calculation of percentage of ingested radioactivity retained in the body. Percentages are relatively high during early life of sculpins, decreasing just before maturity, and increasing slowly throughout remainder of life. Lack of major variations in this level of retention indicate a certain metabolic need, or somewhat constant metabolic accumulation, which comprises approximately 2% of total radiomaterials ingested. (See also Vol 2, No 19, Field 5C, W69-07683). (Jones-Wis)

THE FATE OF RADIOSTRONTIUM IN A FRESHWATER COMMUNITY,
Atomic Energy of Canada Ltd., Chalk River (Ontario). Biology and Health Physics Div.
Ivan L. Ophel.
Proc 1st Nat Symp on Radioecology, Colo State Univ, Fort Collins, Sept 10-15, 1961. Radioecology, Reinhold Pub Corp, NY and Amer Inst of Biological Sciences, Wash, DC, Schultz, Vincent and Klement Jr, Alfred W (Eds), P 213-216, 1963. 5 fig, 2 tab, 4 ref.

Descriptors: *Strontium radioisotopes, *Freshwater, *Ecosystems, Lakes, Acidity, Calcium, Perches, Bullheads, Shiners, Otters, Muskrats, Mink, Beavers, Radioactivity, Seepage, Disposal, Tritium, Cobalt radioisotopes, Radioactive wastes, Sampling, Seasonal, Minnows, Clams, Bottom sediments, Plankton, Cesium.
Identifiers: *Chalk River (Canada), Atomic energy of Canada, Brasenis, Nymphaea, Potamogeton, Pontederia, Typha, Scirpus, Myrica, Ceratophyllum, Lepomis Procyon, Yttrium-90, Ruthenium-106, Sulfur-35, Half-life, Bone, Concentration factor.

Strontium-90 has been followed through a stream-fed ecosystem containing dissolved radionuclides from seeps in a liquid disposal area of the Canadian Atomic Energy establishment. Amounts entering Perch Lake during five years and leaving by an outlet stream were measured. Strontium-90 (Sr-90)

content in the bones of adult perch increased gradually over a four-year period, reaching equilibrium the fifth year. Most of accumulated radiostrontium is retained in the skeleton and a considerable fraction in adult fish bone is non-exchangeable. When the concentration factor for perch flesh is only five, that for bone is 3,000. Transmission of radiostrontium and radiocesium can be compared thus: for water containing the (then) maximum permissible concentration of cesium-137 (Cs-137), maximum permissible body burden of Cs-137 for man would be contained in 20 grams of fish flesh, while maximum permissible body burden of Sr-90 would be contained in 100 kilograms of perch flesh. It would seem, therefore, that the major pathway of radiostrontium--in contrast to radiocecium--to man from a contaminated body of water would be from direct use of water for drinking, rather than by way of food webs originating in the aquatic environment. (See also Vol 2, No 19, Field 5C, W69-07863). (Jones-Wis)

RADIUM IN NATURAL WATERS IN THE UNITED STATES,
Geological Survey, Washington, D.C. Water Resources Div.
Robert C. Scott.
Proc 1st Nat Symp on Radioecology, Colo State Univ, Fort Collins, Sept 10-15, 1961. Radioecology, Reinhold Pub Corp, NY and Amer Institute of Biological Sciences, Wash DC, Schultz, Vincent and Klement Jr, Alfred W (Eds), p 237-240, 1963. 3 fig, 7 ref.

Descriptors: *Radium radioisotopes, *Groundwater, *United States, *Radioactivity, Sampling, Aquifers, Public health, Geological surveys, Kansas, Oklahoma, Missouri, Colorado, New Mexico, Iowa, Illinois, Minnesota, Wisconsin, Michigan, Indiana, Kentucky, Freshwater, Brackish water, Deep wells, Geochemistry, Geologic formations, Shales, Uranium radioisotopes, Limestones, Sandstones, Stock water, Domestic water, North Carolina, South Carolina, Texas, Maine, New Hampshire.
Identifiers: Drinking water, Mississippi Valley, Cambrian, Ordovician, Brine water, Thorium.

Author reports on radium concentrations in groundwater exceeding, on the average, 3.3 micromicrocuries per liter and are considered anomalous. In formations of Cambrian and Ordovician age of the upper Mississippi Valley, in Iowa and Illinois, such anomalous concentrations exist. This area, underlain by high-radium water in aquifers, extends into Minnesota, Wisconsin, the northern Michigan peninsula, and across Indiana into northern Kentucky. However, samples from wells in northeastern Iowa, northern Illinois, and northward to the outcrop formations of Cambrian and Ordovician in Minnesota and Wisconsin generally contained less radium. Of the Roubidoux Formation and Cotter Dolomite of Early Ordovician age, perhaps a southward extension of the anomalous radium area of upper Mississippi Valley, in Kansas, Oklahoma, and Missouri, samples of freshwater with high radium were taken from municipal wells. High-radium water in limestones and sandstones occurs between an outcrop area receiving freshwater recharge and deeply buried parts of the aquifers containing high-radium brines. Of the Cheyenne Sandstone Member of the Purgat oire Formation of Early Cretaceacus age in southeastern Colorado and New Mexico, many wells yield water containing anomalous amounts of radium. Other high-radium areas have been found in the United States. (See also Vol 2, No 19, Field 5C W69-07863). (Jones-Wis)

USE OF LIGHT NUCLIDES IN LIMNOLOGY,
Yale Univ., New Haven, Conn. Geochronometric Lab.; and Yale Univ., New Haven, Conn. Dept. of Geology.
Edward S. Deevey, Jr., Minze Stuiver, and Noboyuki Nakai.
Proc 1st Nat Symp on Radioecology, Colo State Univ, Fort Collins, Sept 10-15, 1961. Radioecology, 1963, Reinhold Pub Corp, NY and Amer Institute of Biological Sciences, Wash, DC, Schultz, Vincent and Klement Jr, Alfred W (Eds), p 471-475. 5 fig, 12 ref.

Descriptors: *Limnology, *Radioactivity, *Carbon, *Carbon radioisotopes, *Sulfur, Lakes, Hypolimnion, Ecosystems, Connecticut, Methane, Carbonate rocks, Fallout, Pondweeds, Groundwater, Mud, Fermentation, Phytoplankton, Sulfates, Rainwater, Metabolism, New York, Analytical techniques, Radioecology.
Identifiers: *Light nuclides, Nuphar, Linsley Pond (Conn), Queechy Lake (NY).

Authors' first studies on carbon in lakes resulted from a search of error in radi ocarbon dating sources. A study of carbon-13 in five lakes, differing in hardness and size, showed carbon in the hypolimnion as, at least, a three-component system: carbon dioxide from spring circulation, oxidation of seston in the water, and anaerobic fermentation in mud. Correction must be made for carbonate rock as source by distinguishing carbonate carbon from fermentation carbon by its carbon-14 content. Carbon-14 studies indicate presence of radiocarbon from nuclear detonations with seasonal fluctuation of fallout. Bomb radiocarbon enters lakes soft enough to be sensitive to labelled atmospheric carbon. Depletion of carbon-14 in deep water suggests that fermentation is active or works on mud whose average carbon is old enough, or that groundwater is similarly depleted (although the lakes are supposedly insulated from groundwater by clay basinseal). Input and distribution of sulfur-34 within lakes is much like carbon. Major source of sulfur, except where rocks are rich in sulfate, is from air as sulfur dioxide. Agricultural fertilizer, sulfur introduced as sea-spray, and industrial sulfur are not probable sources; best explanation for sulfur-enrichment is that lakes are ecosystems metabolizing sulfur. MODE OF FILAMENTOUS GROWTH OF L COTHRIX MUCOR IN PURE CULTURE A IN NATURE, AS STUDIED BY TRITIAT THYMIDINE AUTORADIOGRAPHY,
Indiana Univ., Indianapolis. Dept. of Microbiolo
Thomas D. Brock.
Journal of Bacteriology, Vol 93, No 3, p 985-9 March 1967. 3 fig, 5 tab, 11 ref.

Descriptors: *Bacteria, *Cultures, *Triti Epiphytology, Marine algae, Ecology, Nutrie Seawater, Organic compounds, Habitats, Statist methods.
Identifiers: *Leucothrix mucor, *Growth, *I ments, *Autoradiography, Antithamnion niense, Tritiated glucose, Gonidia formation, L Island Sound (NY), Iceland, Tritiated thymid Narragansett Bay (RI), Cape Reykjanes (Icela Sudurnes (Iceland), Non-parametric tests, C Sample Runs Test, Cluster analysis, Reykjavik (land).

Growth mode of Leucothrix mucor filaments measured by autoradiography with triti thymidine. Studies were performed on L muco pure cultures in free suspension, as an epiphyt pure culture of the red alga Antithamnion niense, and as an epiphyte of red algae in the Statistical analyses of growing cells distribution performed by use of the nonparametric One-S ple Runs Test and a Cluster analysis adapted f quadrat analyses of plant ecologists. No evide of preferential growth at base or tip of L mucor ments was obtained in any of these studies. H ever, in nature, but not in the laboratory, t were regions of L mucor filaments which were growing or dormant. Such nongrowing reg could incorporate tritiated glucose. In labora culture of Leucothrix on Antithamnion, Leucot cannot grow alone in the medium (ASP-6) in w the alga grows, but only when attached to alga. algae seemingly released nutrients into the w where complete mixing occurs. All regions of terial filaments should have equal access to nutrient supply and there should be no preferen growth at the base. In nature, epiphytic bac probably derive their nutrients from seaw (Jones-Wis)

THE ROLE OF ALGAE IN DEGRADING I TERGENT SURFACE ACTIVE AGENTS,
Texas Univ., Austin. Dept. of Civil Engineering
Ernst M. Davis, and E. F. Gloyna.
J Water Pollut Contr Federation, Vol 41, N Part 1, p 1494-1504, Aug 1969. 11 p. 4 fig. 5 21 ref. Grant No NSF-GU-1963.

Descriptors: *Biodegradation, *Algae, *Aq bacteria, Detergents, Surfactants, Alkylben sulfonates, Linear alkylate sulfonates, Water p tion effects, Stabilization, Lagoons, Toxi Waste water treatment, Waste water disposal.
Identifiers: *ABS, LAS.

e rates of degradation of 3 typical nonionic and nionic surfactants by green and blue-green algae re evaluated. Additional data were gathered for ganisms obtained from raw wastewater, activated dge, and waste stabilization pond water. Results w that algae contribute to a small extent in the gradation of common household detergents. st degradation is attributed to bacteria or other ganisms. Algae did not degrade alkyl benzene fonate while bacteria did (0.45 mg/l/day). The er anionic surfactant, linear alkyl sulfonate, was graded in small amounts by some of the different al forms (0.97 mg/l/day by bacteria). Nonionic ergents were more easily degraded. (Knapp-GS)

IE INDIRECT CYCLE OF WATER REUSE,
nford Univ., Calif. Dept. of Environmental En-eering.
orge Tchobanoglous, and Rolf Eliassen.
ter and Wastes Eng, Vol 6, No 2, p 35-41, Feb 69. 7 p, 8 fig, 4 tab, 26 ref.

scriptors: *Water reuse, *Reclaimed water, rificial recharge, Recharge wells, Water spread-, Water quality, Water treatment, Sewage treat-nt, Economics, Water supply.
ntifiers: Indirect cycle reuse.

e indirect cycle may be defined as the return of ter used one or more times to hydrologic and tural cycles for reuse. Treated wastewater is urned through the indirect cycle by surface reading, direct injection, and seepage from pits d septic tank leaching fields. Technical factors t must be considered include the rate of applica-n, the characteristics of the recharge site, quality d quantity requirements, and the availability of table treatment processes. The economic feasi-ity of the indirect reuse of reclaimed water is sed on an analysis of the cost effectiveness of the atment processes used to reclaim it, the cost of nsporting and recharging it, and the cost of alter-tive sources of supply. In the future, the applica-n of reclaimed water for groundwater replenish-nt and the control of salt water intrusion will in-ase as greater demands are placed on existing undwater reserves. ORM DRAINAGE ASPECTS OF THE DEEP NNEL PLAN,
uer Engineering Inc., Chicago, Ill.
J. Bauer.
oc AISI Seminar, Ill Inst Technol, Oct 8, 1968. p, 10 fig, 5 tab.

scriptors: *Water pollution control, *Storm ru-ff, *Pumped storage, *Tunnels, *Illinois, droelectric power, Water storage, Costs, Cost-nefit analysis, Storm drains, Retention.
ntifiers: *Chicago deep tunnel plan.

e proposed Chicago deep tunnel plan would pro-le temporary storage of storm runoff from com-ned sewers to allow steady low-volume treatment d prevent discharge of raw sewage to surface ters. The total cost is estimated to be 242-446 million dollars. Operating costs are expected to be very low because the facility will be large enough to use profitably as a peak-demand pumped storage hydroelectric plant. Storm runoff will be only a small part of the total movement of water. The design and cost analysis of the project are described briefly. (Knapp-USGS)

TREATMENT AND DISPOSAL OF RADIOACTIVE WASTES,
E. Ya. Spitsyn.
Transl from Atomizdat, Moskva, 1965. 102 p, 40 fig, 15 tab, 44 ref, 1 append. Available from the Clearinghouse as TT No 68-50326, $3.00 in paper copy, $0.65 microfiche.

Descriptors: *Radioactive waste disposal, *Waste treatment, Coagulation, Ion exchange, Biodegradation, Evaporation, Underground storage, Injection wells, Safety, Waste dilution, Nuclear wastes, Waste dumps, Waste storage, Solid wastes.
Identifiers: *USSR, Radioactive waste handling.

The disposal of radioactive wastes has always received considerable attention and supervision in the USSR. Norms were introduced and basic regulations promulgated for the disposal of radioactive wastes into the atmosphere, water bodies, and into the soil. The considerable experience that has since been accumulated in the USSR in the design and construction of the necessary radioactive-waste disposal installations and structures is discussed in a textbook which includes descriptions of the techniques for the collection, processing, transportation, and burial of solid and liquid radioactive wastes. Some elementary concepts of nuclear physics, basic definitions, and terminology are given. The techniques of processing liquid and solid wastes are described and technical aspects and health hazards are discussed. Recommendations for the selection of equipment and examples of various calculations are given. The selection on 'cooling' of radioactive wastes is more detailed than the rest of the chapter since the published information on this subject is not sufficient for practical purposes. The transportation and burial techniques of radioactive wastes are described from design data as well as from data provided by the existing burial grounds for radioactive wastes. (Knapp-USGS)

EVOLUTION OF WATER QUALITY GOALS,
Elwood L. Bean.
Journal of the American Water Works Association, Vol 61, No 7, p 317-320, Jul 1969. 4 p, 11 ref.

Descriptors: *Water quality, *Attitudes, History, Administration, Standards, Water works, Water costs, Water quality control, Test procedures, Toxicity, Organic matter, Corrosion, Insecticides, Zeta potential, Nitrates, Nitrites, Viruses.
Identifiers: *Goals, Demand for quality, AWWA Committee on Water Quality Goals.

The article evaluates USPHS water quality standards and relates the rise of new standards. The recent work of an AWWA committee to establish higher standards emphasizes that water must be not only safe, but also clear, palatable, nonstaining and noncorrosive, and not too hard. AWWA has recommended the committee's goals to the water industry. The burden of action is on individual water suppliers, who are responsible to their consumers. Many consumers may stifle attempts for higher quality water because of the common conception of water as 'cheap.' Water works management, which has educated the public toward low cost, should reorient consumers toward quality and create a customer demand for better water. The AWWA Committee on Water Quality Goals has begun a survey to determine the field status of water quality control. Other research needs include: simpler tests to measure corrosivity, toxics and organic constituents; insecticide hazards; refined measurement of either zeta or streaming potentials; effects of minerals on health; reduction of schistosomiasis; nitrate-nitrite dangers; virus control; and improved sensors for monitoring water. (Gossen-Chicago)

ALTERNATIVES IN WATER SUPPLY,
Daniel A. Okun.
Journal of the American Water Works Association, Vol 61, No 5, p 215-221, May 1969. 7 p, 29 ref.

Descriptors: *Dual system, Water quality, Viruses, Chemical degradation, Aesthetics, Attitudes, Education, Pricing, Costs, Automation, Technology, Water sources, Human resources.
Identifiers: Utility tunnels, Regional administration.

After reviewing unmet PHS standards and confronting the possibilities of disease caused by public water, the author discusses three aspects of public water supplies: viruses in water; chemicals in water; and esthetic quality. The dangers of viruses and chemicals may be more far-reaching than they appear. Esthetic quality is so low that a dissatisfied public is turning more and more to bottled water. The recommended action is to establish a dual water supply. Drinking water would be of highest quality, taken from naturally pure sources or produced from brackish or seawater. The second supply might be of questionable quality and esthetically less desirable, but it would be bacteriologically safe through conventional treatment that includes disinfection. Implementation could be achieved by public education or by a discriminating pricing policy. Costs of dual supplies would not differ significantly from conventional systems. Future trends are discussed, including: utility tunnels; automation; regionalization of public water management; new water sources available through technology, and greater utilization of human resources. The article is followed by two discussions of the article: one by Samuel S. Baxter, one by Henry J. Graeser and Albert H. Halff. (Gossen-Chicago)

AID TO MUNICIPALITIES FOR WATER POLLUTION CONTROL.

NH Rev Stat Ann secs 149-B:1 thru 149-B:3 (1964), as amended, (Supp 1967), secs 149-B:4 thru 149-B:5 (Supp 1967).

Descriptors: *New Hampshire, *Cities, *Sewage treatment, *Water pollution, Legislation, Federal government, State governments, Cost sharing, Construction, Water pollution control, Regulation, Engineering, Treatment facilities, Sewers, Public health, Administrative agencies, Surface waters, Cost repayment, Disposal, Amortization, Installation, Maintenance, Operating costs, Grants, Legal aspects, Costs, Sewage disposal.

The state of New Hampshire shall, in addition to the federal grant, pay annually 30% of the yearly amortization charges on the original costs resulting from the acquisition and construction of sewage disposal facilities by municipalities for the control of water pollution. The approval of such construction must first be obtained from the Water Pollution Commission. Those municipalities that began construction of their facility before July 1, 1947 shall be entitled to receive their full costs retroactively. Any municipality which qualified for state contribution shall receive an additional 10% amortization from the state yearly. All pollution control facilities must be installed in accordance with specifications approved by the Water Pollution Commission, and failure to comply with such plans will result in the loss of payments to the municipality. (Shevin-Fla)

INSTREAM AERATION OF POLLUTED RIVERS,
Rutgers - The State Univ., New Brunswick, N.J. Water Resources Research Inst.
W. Whipple, Jr., J. V. Hunter, B. Davidson, F. W. Dittman, and Shaw L. Yu.
Available from the New Jersey Water Resources Research Institute for $2 per copy. Water Resources Research Institute, Rutgers - The State University of New Jersey, New Brunswick, Aug 1969. 196 p, 41 tab, 56 fig, 78 ref. FWPCA 16080 DUP.

Descriptors: *Aeration, *Dissolved oxygen, *Water quality control, *BOD, *Optimization, Oxygen, Oxygen sag, Water pollution treatment, Water quality, Optimum development plans, Systems analysis.
Identifiers: *Instream aeration, *Induced aeration, *BOD mass balance, Mechanical aerator, Diffused aerators, Dynamic simulation.

Mechanical and diffuser instream aerators were tested on the Upper Passaic River and proved a practical and economical method of adding dissolved oxygen to polluted streams. The tests were conducted in conjunction with research into photosynthesis, benthal oxygen demand, and mass balance of BOD in that river system. Systems of aerators were designed to provide for meeting water quality objectives of dissolved oxygen, and cost estimates made. Alternative costs of meeting the same objectives by means of advanced effluent treatment alone appear to be several times as great. It is concluded that instream aeration may provide a feasible alternative to advanced waste treatment for polluted rivers, as a supplement to secondary waste treatment.

POLLUTION AND ENVIRONMENTAL QUALITY,
Resources for the Future, Inc., Washington, D.C.
Robert U. Ayres, and Allen V. Kneese.
IN The Quality of Urban Environment: Essays on 'New Resources' in an Urban Age, p 35-71, edited by Harvey S. Perloff, Resources for the Future, Inc. The Johns Hopkins Press, Baltimore, 1969. 37 p fig, 10 tab.

Descriptors: *Management, *Planning, *Qual control, *Waste disposal, Pollution, Air pollutic Water pollution, Solid wastes, Marketing, Costs.
Identifiers: *Total environmental approach, *E vironmental planning, *Environmental quali Reprocessing, Interdependencies.

Traditionally environmental pollution has been a proached in a fragmented way; air, water, a solids pollution are each dealt with separately. T discussion is organized in terms of the main sect of the economy which produce waste, particula urban areas, and an attempt is made to look at t waste problem in its entirety. Environmental pol tion and its control is viewed as a materials balan problem for the entire economy. Detailed empi cal estimates of actual discharges of residuals to t environment and a discussion of some technologi for their modification is given. Using a schema residual materials flow for the household sect excluding automobiles, the interdependencies the various waste streams is shown. The point made that our market mechanism fails to deal a propriately with the entire resources allocati problem and does not adequately reflect the co of disposing of residuals, including any costs to t overall society associated with their discharge in the environment. Two ways of dealing with t problem are given. Both call for internalizing t problem to take account of all costs and benefi The system to be used in reorganizing our soc policy to produce different relative burdens bei placed on various residual receiving environmen media is described. (Marriott-Chicago)
W69-09563

ECONOMIC FRAMEWORK FOR SALINI CONTROL PROJECTS,
Philip J. Coffey, and Leonard Ortolano.
Journal of the American Water Works Associati Vol 61, No 5, p 237-241, May 1969. 5 p, 2 fig tab, 16 ref.

Descriptors: *Water quality control, *Econo efficiency, Salinity, Project planning, Hardn (Water), Costs, Benefits, Optimization.

The article focuses on determining the degree water quality enhancement that should be provi where salinity is the major quality indicat Benefits are perceived as costs avoided downstream users due to salinity reduction. purpose of this article is to suggest a design for economically efficient control program. Analysi limited to the case where loads and level of wa use are constant. A n analogy is made between method and the techniques used in planning fl protection. Section I discusses special problems mineral pollution control. Section II describes proposed method for relating costs of salinity c trol to water quality. The method fulfills economic criteria established by the Preside water resources council in 1962: (1) total tangi benefits exceeding costs; (2) marginal benefits each separable unit of a project exceeding its c and (3) scope of development sufficient to m imize net benefits. Section III applies the meth Section IV discusses the value and limitations the method. It should be useful in developing a p gram to relieve a current condition of saline po tion. It will not give answers for situations that volve a developing basin economy. (Goss Chicago)

POLLUTION: REGULATION AND THE TITRUST LAWS,
Philip K. Verleger, and Jennie M. Crowley.
Nat Resources Lawyer, Vol 11, No 2, p 131-1 May 1969. 11 p, 46 ref.

Descriptors: *Air pollution, *Legislation, *Reg tion, *Administrative agencies, Clean Air A Public health, Public rights, Pollution, Industr

leral government, State governments, Institu-
al constraints, Solvents, Judicial decisions,
al aspects, Water pollution, Political aspects,
ial aspects.
ntifiers: *Antitrust laws, Sherman Act, Clayton
, Federal Trade Comm'n Act.

e to the great masses of industry, the pollution
blem has become acute. A number of regulato-
agencies have been designed to deal with the
blem. However, regulation does not gain quality
en imposed without the guidance of those regu-
d. The author feels that the only way to a solu-
n is through consultation between industry and
ernment and among industries themselves. It is
his point that the problem of antitrust violations
ers. Under the Sherman Act, the Clayton Act,
the Federal Trade Commission Act, any con-
ation among industry in relation to business
ctices may be subject to attack as a violation of
itrust laws. The government has refused to grant
se industries immunity from prosecution, and as
esult they shy away from consultation. Cases
ling with antitrust violations are studied in the
cle. The author feels that the right to col-
orate in dealing with the government is absolute
that such collaboration is the key to pollution
trol. (Shevin-Fla)

MUNICIPAL AND COUNTY GOV'T (SEWAGE SYSTEM).
Vt Stat Ann tit 24, secs 3501-3508 (1959).

Descriptors: *Vermont, *Sewage, *Sewage disposal, *Cities, Legislation, Regulation, Waste disposal, Wastes, Sewage treatment, Administrative agencies, Administrative regulations, Facilities, Local governments, Utilities, Public utilities, Taxes, Water rates.
Identifiers: Domestic sewage, Storm water, Storm sewage, Sanitary sewage, Sanitary treatment.

A municipal corporation may construct, maintain, and operate a sewage system and is authorized to purchase or acquire necessary real estate and easements. The municipal corporation may contract to make disposal of domestic or storm water sewage. The property owner using the sewage system shall be liable for rent, such rent being a lien on the real estate furnished with the service. The municipal corporation may purchase and hold realty and personalty and may levy and collect taxes necessary for the payment of the expenses and indebtedness of such sewage system. A board of sewage systems commissioners is created to supervise the municipal systems and to establish all needed rates for rent, with rules and regulations for its control and operation. BRADY V SPRINGDALE (CONDEMNATION ACTION FOR DESTRUCTION OF SPRINGS).
441 SW 2d 81-84 (Ark 1969).

Descriptors: *Arkansas, *Condemnation, *Springs, *Sewage disposal, Legal aspects, Judicial decisions, Condemnation value, Air pollution, Sewage, Sewage treatment, Easements, Eminent domain, Sewers, Cities, Pipes, Water pollution, Water pollution effects, Air pollution effects, Spring waters, Damages, Land tenure, Underground, Contracts, Tiles, Engineering structures, Waterworks, Odors.

Defendant condemned a permanent easement through plaintiff's land and plaintiff brought this action to recover damages for diminished value of the remaining land. Plaintiff claimed a reduction in the value of his land due to destruction of a spring and air pollution over his property from defendant's sewage disposal facility. A jury trial resulted in an award of $750 as compensation for the easement. Plaintiff appealed seeking a new trial. The court held that the jury's verdict would not be disturbed unless it was clearly erroneous. The court found that the testimony at the trial was conflicting both as to the nature of the spring which was allegedly destroyed, and as to the offensiveness of the odor from the sewage plant. The court held that in view of this conflicting evidence, the jury was justified in reaching its conclusion and the verdict was affirmed. (Shevin-Fla)

WATER POLLUTION CONTROL.
Iowa Code Ann secs 455B.1 to 455B.28 (Supp 1969).

Descriptors: *Iowa, *Water pollution control, *Water quality control, *Standards, Legislation, Administrative agencies, Water quality, Impaired water quality, Project planning, Legal aspects, Permits, Waste disposal, Sewage disposal, Regulation, Water conservation, Water resources development.

Iowa public policy is to conserve state waters and to protect, maintain, and improve the quality thereof; to prevent the discharge of inadequately treated waste; to provide for the control of water pollution; and to cooperate with state and federal agencies toward these objectives. The Iowa Water Pollution Control Commission is created with the powers and duties: (1) to supervise and enforce all laws relating to water pollution; (2) to develop comprehensive programs for water pollution control; (3) to cause the state Department of Health to conduct investigations; (4) to establish water quality standards; (5) to require the filling of disposal systems plans for approval or disapproval; (6) to direct the regulation of permits relating to waste or sewerage discharge and installation of disposal systems; and (7) to hold hearings. In establishing quality standards, the Commission should consider the public health, the nature of the water, the character and use of the adjacent land, the past, present and potential uses of the water, the extent of natural contamination, and the extent to which solids bacteria, organisms, toxic substances, and oxygen demanding substances should be permitted. DRAINAGE OF COAL AND MINERAL LANDS AND MINES.
Iowa Code Ann secs 468.1 to 468.9 (1949).

Descriptors: *Iowa, *Surface drainage, *Mine drainage, *Compensation, Payment, Exploitation, Land tenure, Mineral industry, Coal mines, Eminent domain, Right-of-way, Condemnation, Legislation, Relative rights, Drainage programs.

Any person or corporation owning or possessing land underlaid with coal which cannot be mined due to an accumulation of surface water, may drain the water over the surface of land belonging to another upon agreement or judicial determination by condemnation of the damages to be paid for such drainage. Any person or corporation which in any way removes water from lead or zinc bearing lands to make them productive, shall receive on demand 1/10 of any lead or zinc removed therefrom. The person entitled to 1/10 of the minerals may examine the mines and premises of the owner, and if the owner at any time obstructs the exercise of the right to 1/10 of the minerals, a double recovery shall be allowed. Any person holding a 1/10 drainage compensation right may garnishee minerals from smelters upon notice. Any person or corporation engaged in draining lead or zinc bearing lands may obtain necessary rights of way in order to convey water from the land, with damages determined by agreement or judicially through eminent domain. No landowner is compelled by this chapter to remove minerals from his land. (Harris-Fla)

WATER POLLUTION IN REMOTE RECREATIONAL AREAS,
Forest Service (USDA), Duluth, Minn. Superior National Forest.
Michael A. Barton.
J Soil and Water Conserv, Vol 24, No 4, p 132-134, Aug 1969. 3 p, 4 photo, 1 tab, 7 ref.

Descriptors: *Water pollution control, *Recreation wastes, Waste disposal, Nutrients, Sediments, Water pollution sources, Pesticides.
Identifiers: *Wilderness areas.

Continued population expansion and increased leisure time and affluence will require that wilderness areas absorb greater and greater use. These areas must be protected if they are to survive. Too often wilderness environments are ecologically delicate. Using standards of clean water normally considered appropriate in water quality control programs, wilderness waters could be degraded significantly before uses other than recreation would be damaged. Little consideration is given to nutrient enrichment in formulating standards. Greater emphasis must be accorded nutrients, the aquatic growths they produce, and the impact nutrients have on aesthetic qualities. Special standards must be formulated and strictly enforced in wilderness areas. (Knapp-USGS)

EFFECT OF RECREATION ON WATER QUALITY,
Forest Service (USDA), Upper Darby, Pa. Northeastern Forest Experiment Station.
Irvin C. Reigner.
Univ. Mass. Coop. Ext. Serv. Pub. 446: 49-55, 1966. (Municipal Watershed Management Symposium Proceedings, 1965).

Descriptors: *Watershed management, *Recreation, *Water quality, Recreation demand, Fishing, Boating, Camping, Swimming, Aesthetics, Land use, Multiple-purpose projects, Recreation facilities, Reservoirs, Golf courses, Northeast U.S., New England.

Although forested municipal watersheds in the Northeast offer possibilities for both land and water recreation, their use has been limited by the necessity to protect water quality. Reviewing the impact of various kinds of recreation on water quality leads to the conclusion that, while recreation has not seriously degraded public water supplies, this has only been due to the determined effects of municipal authorities to prohibit or minimize recreation on watersheds and reservoirs. Increasing pressures for recreation may be met by assigning a recreation specialist to the staff of the water supply administrator. More research is needed both in the detection and treatment of pollutants, in the location of recreational facilities, and the control of recreationists; this review of current conditions helps set the stage for future research.

Descriptors: *Tax incentives, *Effluent charges, *Regional systems, *Efficiency, Federal government, Wisconsin, Sewage service charges, Optimal water quality.
Identifiers: *Economic incentives, Wisconsin.

Alternative programs for water quality management are examined from efficiency, equity and financing viewpoints. The programs examined include various direct regulatory policies, tax incentives, investment credits and loan programs, effluent charges and regional systems. Both Federal and Wisconsin fiscal incentives are analyzed as to their effect on the behavior of waste producers. Effluent charges and the problem of their implementation are discussed. A review of sewage service charges is used as a background for regional water quality systems employing joint treatment facilities. Effluent charges are also discussed as a method of financing joint facilities using either marginal or average pricing schemes.

Plaintiffs were landowners in Montgomery Cou who desired their land to be zoned as a high dens residential area. Defendant County Council h filed a master zoning plan which called for pla tiffs' land to be zoned as a low density residenti area. The stated purposes of defendant's mast plan were the preservation of open spaces and pr tection of the watershed area from pollution caus by inadequate sewage processing facilities. T court noted that the test of the validity of a co prehensive rezoning is whether it bears a substa tial relationship to the public health, comfo safety, convenience, and general welfare. T court found that defendant's master plan met t test of validity and held for the defendant. (Keit Fla)

ATER POLLUTION CONTROL COMPACT.
Rev Stat Ann secs 488:1 thru 488:1 (V)
68).

scriptors: *Interstate compacts, *Water pollu-n, *Water pollution control, *New Hampshire, w England, Vermont, Massachusetts, Maine, ode Island, Connecticut, New York, Legislation, gulation, Water law, State governments, Public efits, Public rights, Administrative agencies, Water policy, Public health, Interstate, Interstate commissions, New England Interstate WPS Compact.

The Water Supply and Pollution Control Commission is authorized to enter into a compact with any one or more of the New England states plus New York, under the provisions of the New England Interstate Water Pollution Control Compact. It is agreed between the signatory states that the provisions of the Compact shall apply to streams, ponds, and lakes which are contiguous to two or more signatory states, which flow through two or more signatory states, or which have a tributary contiguous to two or more signatory states, and such provisions shall also apply to tidal waters ebbing and flowing past the boundaries of two states. The Commission, a body corporate and politic, shall consist of five commissioners from each signatory state. These members shall represent the state health department, the state water pollution control board, municipal interests, industrial interests, and an agency acting for fisheries or conservation. For any action of the Commission to impose an obligation on member states, a majority of the members from each signatory state must vote in favor thereof. (Moulder-Fla)

WATER POLLUTION CONTROL COMPACT.
NH Rev Stat Ann secs 488:1 (d)-488:2 (1968).

Descriptors: *New Hampshire, *Water quality control, *Administrative agencies, *Water pollution control, Legislation, New England, Sewage, Waste treatment, Industrial waste, Water quality, Water pollution, State jurisdiction, Recreation, Waste disposal, Systematics, Shellfish, New England Interstate WPS Compact, Standards, Water policy, Interstate commissions.

No single standard of sewage and waste treatment is considered practical, and the degree of treatment of sewage in industrial wastes should take into account the classification of the receiving waters according to present and proposed highest use. The commission establishes reasonable physical, chemical, and bacteriological standards of water quality satisfactory for various classifications of use. Each signatory state pledges to provide for the abatement of existing pollution and for the control of future pollution of interstate inland and tidal waters; however, nothing in this compact should be construed to repeal or prevent the enactment of any legislation imposing any additional condition or restriction to further lessen the pollution of waters within each state's jurisdiction. The signatory states also agree to appropriate for expenses such sums as shall be recommended by the commission, and each state with the exception of New York shall set limits on the amounts to be obligated. The compact is effective immediately upon adoption by any two contiguous states of New England but only insofar as it applies to those states and upon approval by federal law. (Moulder-Fla)

Identifiers: Injunctions (Prohibitory).

For public protection the state will maintain standards of purity in its waters consistent with their use for domestic and industrial water supplies and will regulate discharge of wastes. The statute creates the Sanitary Water Board to carry out the purposes of the act. The Board determines if pollution exists in any given body of water and is empowered to require discontinuance of pollution through its own orders or through court action. The board may issue or withhold permits to discharge wastes or sewage, may require submission of plans and specifications for new sewage works, and may develop a comprehensive plan of pollution control. The statute outlines procedure for enforcement of board orders. Draining or dumping pollutants into the waters of the state is expressly prohibited unless a permit is properly secured. Permits are also required for increasing amounts of pollutant drainage. Fines are imposed for violations, and injunctive relief is available through action by the attorney general. The act is not designed to alter acts pertaining to oil, gas, and coal resources, nor does it interfere with existing sanitary district operations. (Kelly-Fla)

OHIO RIVER VALLEY WATER SANITATION.

Ill Ann Stat ch 111 1/2 secs 117-121 (Smith-Hurd 1966).

Descriptors: *Illinois, *Water pollution control, *Interstate commissions, *Interstate compacts, Environmental sanitation, United States, Indiana, Kentucky, New York, Ohio, Pennsylvania, Tennessee, West Virginia, Virginia, Legislation, Ohio River, Interstate rivers, Water quality control, Industrial wastes, Sewage.

The Ohio River Valley Water Sanitation Compact between Illinois, Indiana, Kentucky, New York,

Ohio, Pennsylvania, Tennessee, and West Virginia is enacted into law. The compact provides that the signatory states from a common agency to control pollution of the Ohio River basin by creating a sanitation district which includes any water flowing into the Ohio River. The Ohio River Valley Water Sanitation Commission is provided for and is composed of three members from each member state and three from the United States government. The purpose of the compact is to keep pollution from sewage or industrial waste from harming interstate waters and public health. The Commission is empowered to make rules for regulation and sanitation, to study and report upon the pollution problems, and to make recommendations to the various states, communities and corporations with regard to such improvements. The Commission, after notice and hearing, may issue orders to those violators of these rules, and such orders are enforceable in any United States district court located in any signatory state. (Darragh-Fla)

Sewage disposal (including industrial sewage) is the responsibility of the board of trustees of all sanitary districts. These districts must attempt to preserve their water supply from contamination. For this purpose they may construct necessary enclosed conduits and pipes. The board is also responsible for drainage within the district and must supply necessary drains, ditches, channels and outlets for this purpose. Treatment and purification of sewage when same shall flow into any lake or watercourse falls within the board's spectrum of duties. When disposal of industrial wastes cause an increased economic burden the board may levy an assessment against the producer thereof to pay the excess costs. The district is responsible for the various aspects related to operation of a sewage system including: acquisition and maintenance; coordination and control of interconnections with tributary sewer systems; and fees for inspection prior to connection with the system. The district acquires property by purchase, condemnation or otherwise as required for its corporate purposes. Compensation to landowners for such property may be in gross sum or in annual rental payments. (Johnson-Fla)

THE LINEAR DECISION RULE IN RESERVOIR MANAGEMENT AND DESIGN. I. DEVELOPMENT OF THE STOCHASTIC M ODEL,
Johns Hopkins Univ., Baltimore, Md.; and Geological Survey, Washington, D.C.
Charles Revelle, Erhard Joeres, and William Kirby.
Water Resources Res, Vol 5, No 4, p 767-777, Aug 1969. 11 p, 2 tab, 9 ref.

Descriptors: *Reservoir design, *Reservoir operation, *Water management (Applied), *Optimization, *Systems analysis, Stochastic processes, Model studies, Statistical models, Linear programming, Markov processes, Dynamic programming, Decision making.
Identifiers: Reservoir operation models, Stochastic models.

With the aid of a linear decision rule, reservoir management and design problems often can be formulated as easily solved linear programming problems. The linear decision rule specifies the release during any period of reservoir operation as the difference between the storage at the beginning of the period and a decision parameter for the period. The decision parameters for the entire study horizon are determined by solving the linear programming problem. Problems may be formulated in either the deterministic or the stochastic environment. ON THE RANDOM OCCURRENCE OF MAJOR FLOODS,
Geological Survey, Arlington, Va.
William Kirby.
Water Resources Res, Vol 5, No 4, p 778-784, Aug 1969. 7 p, 4 fig, 6 ref.

Descriptors: *Flood forecasting, *Statisti methods, *Probability, Model studies, Statisti models, Hydrograph analysis, Rainfall-runoff re tionships.
Identifiers: Poisson flood forecasting mod Recurrence intervals.

Plausible hydrologic arguments imply that flo can be represented as the successes or exceedan in a sequence of randomly spaced Bernaulli tri representing the occurrence of hydrograph pea This representation generalizes existing flood currence models by admitting an arbitrary pro bility distribution of the times between trials and arbitrary criterion for distinguishing betwe floods and ordinary hydrograph peaks. Analysis this model shows that at sufficiently small ceedance probabilities the probability distributio and moments of the interexceedance time, waiting time to the next exceedance, and number of exceedances approach those implied the occurrence of trials in a Poisson process. T theory therefore constitutes a rational justificati of Poisson models of flood occurrence as well a rational explanation of empiric observations. (napp-USGS)

history of Georgia's water resources is presented om Colonial times to the present including a scussion of the social and economic aspects of e water resources development. Water resources es and problems are discussed. The need for a ate water plan and the development of a cogni-ve planning process to prevent oversight of cer-in water resources planning needs is discussed. A mmary of water resources development and use Georgia is presented. The planning objectives, e planning process, planning strategies, and anning tactics for planning, using, and conserving eorgia's natural human and capital resources are esented together with a synoptic outline for in-ntories of the resources. The paper contains a mmary and has 11 bibliographical references. Conway-Ga Inst of Tech) 69-09728

TOCHASTIC PROGRAMMING: A SURVEY,
isconsin Univ., Madison.
harles E. McQuillam.
niv of Wisconsin, Water Resources Center, echnical, Report, Mar 1969. 65 p.

Descriptors: *Stochastic processes, *Optimization, Computers, Computer programming.
Identifiers: Probabilistic programming, Vector optimization, Optimum value, Programs with recourse, Chance constrained programs.

This work provides an organization and summary of the major results in the field of stochastic (or probabilistic) programming. Mathematical derivations and proofs are largely omitted both for lack of space and because they are unnecessary. The purpose of this work is to give an overview of the field and references for those who wish to investigate further. Initially, a very general problem of programming under uncertainty is defined. Next, various ways of interpreting this problem and the resulting methods of handling its uncertainty are discussed. The bulk of the paper is devoted to those interpretations which appear to have received the most attention in the literature: vector optimization, the distribution of the optimum value, programs with recourse, and chance constrained programs. Finally, a few special topics are considered.

Identifiers: *Nuclear power, Fossil fuels, *Northfield Mountain Proj (Mass), Base loads, Spinning reserve.

Construction of pumped-storage hydro plants, favored by area topography, will offset the relatively high fixed costs of nuclear plants by maximizing the capacity-use factor of nuclear facilities and minimizing the total cost per unit of energy output. This combination provides efficient base load, economical peaking capacity, effective spinning reserve, and many recreational and other social benefits. Power companies in the New England states, where fossil-fuel cost is high, have determined that low-variable-cost nuclear generation is desirable for this region. The 1000-mw pumped-storage Northfield Mountain Project in Massachusetts, used for peaking and reserve standby in the New England power systems, is reviewed, giving specific references to economies and social benefits derived from the project. Cost comparisons of base-load nuclear units in combination with gas turbine, steam peaking, and pumped hydro plants are given for the 1973 and 1977 predicted large-area loads in the New England states. ORGANIZATIONAL ALTERNATIVES FOR RECREATIONAL RESOURCE MANAGEMENT: AN ANALYSIS OF STATE AGENCIES,
Michael F. Brewer, and Betty Bordner.
Natural Resources Journal, Vol 6, No 4, p 560-579, Oct 1966. 20 p, 13 ref.

Descriptors: *Administrative agencies, Inter-agency cooperation, Political aspects, Planning, Economic efficiency.
Identifiers: *Recreational resource management, State agencies, Scope of jurisdiction, Objectives, Interest groups.

The purpose of this study is to identify the specific activities entailed in recreational resource management; to determine the particular organizational arrangements for these activities; and to evaluate typical state organizations employed for these purposes. Consideration was also given to those public recreational resources for which responsibility is divided among a number of organizations. First, the structures of recreational agencies sharing responsibility in particular states were identified, classified, and evaluated in terms of the way they perceive the objectives of recreational resource management and in terms of their scope of jurisdiction. Second, the influence of this organizational structure upon a constituent agency was assessed using criteria generally consistent with the welfare-economics notion of efficiency. Results indicate that the greatest advantage of single-resource agencies is their ease of access to interest groups. However, their limitations with respect to a broad planning scope, a wide range of technical competence, and common analytical practices severely limit their advantage of access, especially in planning. Unified agencies are strong in planning scope, technical competence, and uniform analytical procedures. They also have potential for establishing communication to interest groups. (Gossen-Chicago)

Identifiers: *Portsmouth (Ohio), *Scioto County (Ohio).

Scioto County and Portsmouth, Ohio have experienced a depressed economy as a result of changes in industry. These areas desire to improve their economic conditions through planning. One possibility is the creation of a marina and related recreation facilities near Portsmouth, Scioto Coun-

ty, Ohio. Analysis of the population and boat use in the geographic area that such a marina would draw from shows adequate demand to justify installation on the Ohio River of a marina-recreation facility having berths and year-around storage for approximately 100 boats. Also included in the project would be facilities for servicing and launching boats; an Operations Building; Sales, Service, and Administration Building; Snack Bar and Restaurant; and Parking Area. Five possible site locations are analyzed in relation to topography, river characteristics, accessibility, and relation to cultural features. The feasibility of the project is analyzed by developing the annual benefit and costs of the proposed project. The proposed project is found to be economically feasible and would have demonstratable economic impact on the area. It is recommended that the project be implemented by public agency construction of the project with lease of the facilities to a private business venture for operation and maintenance. THE MILWAUKEE RIVER,
Milwaukee River Technical Study Committee, Wis.
Harry C. Brockel.
Milwaukee River Tech Study Comm Rep, 1968. 163 p, 5 fig, 5 map, 43 photo, 11 tab, 62 ref.

Descriptors: *Rivers, *Urbanization, *Multiple-purpose projects, *Recreation, *Wisconsin, Navigation, Aesthetics, Parks, Recreation facilities, Landscaping, Land use, Scenery, Water quality, Water pollution, Water pollution control, Planning.
Identifiers: Milwaukee River, Milwaukee.

The problems of the Milwaukee River, Wisconsin were inventoried and recommendations are listed for improvement of the river for aesthetic and recreational uses for the city of Milwaukee. The present quality of the river water and banks are surveyed and compared with past conditions as well as present conditions of rivers in other cities. It is concluded that the Milwaukee River can be a great asset to Milwaukee with a reasonable expenditure of time, money, and effort. The present blighted condition of the river banks in the downtown area should actually help in land acquisition for restoration, because it has depressed land prices. San Antonio, Texas is used as an example of what a city can do in restoring a river for public emjoyment. (Knapp-USGS)

TOWARD A NATIONAL WATER PLAN,
Lewis Gordy Smith.
Pap, Irrig Age, 1969. 23 p, 18 fig.

Descriptors: *Planning, Water reuse, Import, Natural resources, *Water resources development, *Water collection system, Water, Pumping plants, Water conveyance, Population growth, Preliminary investigations, Canals, Water requirements, Cloud seeding, Demineralization, Reservoirs, *Water distribution (Applied), Tunnels, Dams, Siphons, Inter-basin transfers.
Identifiers: *Water plans, Canada, *Western United States, International cooperation.

Water is the one limiting basic resource having the most influence on the comforts of an expanding population of this nation. The greatest challenge to the Western United States is a need to overcome the persistent lack of water. A concept of a water collection and distribution system using northern Canadian water to provide water for the Prairie Provinces of Canada and the 17 Western States of the U S is discussed. The elements of a comprehensive water augmentation system for the Great Lakes region are outlined. Because of the recognized importance of this single unique commodity, water augmentation merits a new, higher priority among our national policies for the economic justification of large water augmentation projects and t hose affecting whole segments of the nation, and, thereby, the entire nation. Implementing such a water plan requires much time; planning must start many years before the actual need exists. (USBR)

**STRATEGIC CONSIDERATIONS IN ATTAI
ING WATER RESOURCES PLANNING GOAL**
Wisconsin Univ., Madison.
I. K. Fox.
Journal Water Pollution Control Federation, Ju
1969, Vol 41, No 7, p 1368-1376. 9 p, 5 ref.

Descriptors: *Administrative agencies, Wa
resources development.
Identifiers: *Conservation agencies, Decision ma
ing processes, Public planning, Strategies.

This paper suggests how planning fits into decisio
making in a democratic system, how it contribut
to the effectiveness of the system, and what stra
gies planning entities should use to maximize effe
tiveness. Since people have differing val
preferences, not all people will favor the sa
plans. The function of public planning is to ident
and evaluate alternative courses of action so as
aid individuals and organizations in deciding wh
course of action they favor. Since the objective is
secure a complete airing of differing objectives a
potential programs, the various interests shou
have the opportunity to marshall and present pr
grams which they support. These concepts sugg
different strategies for different agencies and
ganizations. The Executive Office of the Preside
as an agency that seeks to represent the nation a
whole, should foster the presentation of competi
plans so that it can make a more intelligent choi
among the alternatives. The federal water develo
ment agencies should present alternative plans
public consideration, if the danger of stalema
among competing interests is to be avoided. T
state agencies should pursue a planning role ind
pendent of the federal agencies until alternati
have been assessed and the state interest det
mined. The conservation agencies should be staff
to prepare and support plans that best serve th
own interests. And the private interest grou
should not only criticize and support the plans
others, but should also be staffed to prepare a
support plans that best serve their interests. T
framework would enrich the supply of informati
about alternative plans and thus improve decisio
making processes.

6C. Cost Allocation, Cost Sharing, Pricing/Repayment

CONVENTION AND LIMITATION IN BENEFIT-COST ANALYSIS,
Richard J. Hammond.
Natural Resources Journal, Vol 6, No 2, p 195-222, Apr 1966. 28 p, 28 ref.

Descriptors: *Cost-benefit analysis, Decision-making, History, Optimization, Return (Monetary), Cost-benefit ratio, Legislation.
Identifiers: *Green Book, Informed common sense, Opportunity costs, Benefit minus cost.

The article addresses itself to two questions: (1) How, and how far, is it possible to secure uniformity of practice between different agencies using benefit-cost analysis. (2) At what point does a further increment of speculation promise less than a commensurate increase in the accuracy of the forecast. A history is given of the rise of benefit-cost analysis to its exalted position of authority in resource questions. Development of the Green Book is described. The most influential and persistent error in the Green Book stems from the fallacy of maximizing net returns. By failing to consider the differences in opportunity costs, the prescribed method of analysis often fails to seek the maximum return on capital. Inclusion of opportunity costs reinstates the use of benefit-cost ratios over benefit minus cost. The article emphasizes that a prescriptive rule of behavior is not applicable to every case without qualification. Congress is not absolved of its final responsibility of decision by calculations which seem, falsely, to have dispensed with uncertainty. The range of error in benefit-cost analysis prohibits calling it 'accurate'; it is a measure of putative performance and no more. (Gossen-Chicago)

THE FINANCING OF SMALL MUNICIPAL WATER SYSTEMS IN GEORGIA,
Georgia Univ., Athens. Dept. of Agricultural Economics.
Howard Waldas.
MS Thesis, Univ of Georgia, Athens, Ga, Aug 1968. 218 p, 7 fig, 19 tab, 31 ref, 1 append. OWRR Proj B-011-GA.

Descriptors: *Municipal water, *Water rates, *Water costs, *Interest rate, *Financing, *Georgia, Cost repayment (Ability), Water values, Elasticity of demand, Government finance, Public utilities.

Objectives of the research were (1) to determine what methods of financing water systems are available to smaller municipalities, (2) to select and analyze the various factors that affect the abilit y of municipalities to obtain financing for developing their water systems, and (3) to indicate the future of financing of municipal water systems by the projection of current trends. Data on municipal interest rates and repayment abilities together with other pertinent information were obtained by personal survey of a randomly selected ten percent of Georgia's smaller municipalities. Officials of 49 municipalities with populations under 10,000 were interviewed. Three major sources of funds for municipal water systems are analyzed: (1) Water revenues from special assessments, user charges, fire protection fees, connection fees, and ad valorem taxes, (2) municipal securities composed of general obligation, special assessment, and revenue bonds, and (3) Federal loans and grants from the Farmer's Home Administration, the Economic Development Administration, and the Soil Conservation Service. Factors that affect the interest rate and the repayment ability of a municipality have been isolated and their significance measured. Models were designed from measured variables to permit a small Georgia city to compute the interest rate and repayment ability that could be expected from their financial status. Use of the models by smaller, unrated municipalities will enable them to have their financial position considered objectively by potential investors. Projections indicate that 56.7 percent of water systems financed by the cities sampled will be through Federal grants and loans. The trend toward Federal funds for financing small municipal water systems will continue as long as Federal programs offer lower interest rates. (Conway-Ga Inst of Tech)

THE DEMAND AND PRICE STRUCTURES FOR WATER IN A HUMID AREA,
Georgia Univ., Athens. Dept. of Agricultural Economics.
Ronald M. North.
Department of Agricultural Economics, College of Agriculture, University of Georgia, Athens, Georgia, July 1969. 6 p, 10 ref. OWRR Project B-011-GA.

Descriptors: *Georgia, *Water costs, *Water rates, *Elasticity of demand, *Elasticity of supply, *Humid areas, Economics, Marginal productivity, Social values, Monetary returns, Southeast U.S., Municipal water systems, Water users.

The purpose of this study was to determine the price and income elasticities for water consumption in the humid Southeastern United States. Householders in 14 municipal water systems were interviewed for socio-economic characteristics and water consumption was correlated with these characteristics. In the Southeast the physical factors such as lawn area did not significantly affect household consumption of water. However, definite differences in consumption of water were found due to variations in prices of water and incomes or income surrogates such as value of the residence. Price elasticities were generally about -0.68 and income elasticities were generally about+0.80. Industrial consumption in poultry processing plants, textile finishing and pulp manufacturing varied considerably among plants in each industry according to gross use and use per unit of product. However, these variations appeared more closely related to such things as age of plant and management practices and not to the price of water nor to the value of marginal product produced by that water. (Conway-Ga Inst of Tech)

FACTORS INFLUENCING THE DEMAND FOR WATER IN POULTRY PROCESSING PLANTS,
Georgia Univ., Athens. Dept. of Agricultural Economics.
Donald L. Brewer.
MS Thesis, Univ of Georgia, Athens, Ga, June 1969. 94 p, 3 fig, 1 tab, 54 ref, 6 append. OWRR Proj B-0011-GA.

Descriptors: *Water demand, *Water costs, *Water values, *Marginal prices, *Southeast U.S., Wages, Georgia, Water users, Water reuse, Elasticity of demand, Industrial water.
Identifiers: Poultry industry, Poultry processing.

Objectives of the research were to determine the demand and factors influencing the quantity of water used in poultry processing plants and to determine the physical differences in the processing plants and how the differences affected water use. Data were collected by personal interview from randomly selected poultry processors located in a six-state area in Southeast U.S. From these data variables were selected to determine the influence on water usage by the processors. The production function was used also to derive the demand for water. Five independent variables were found that explained best the total amount of water withdrawn. These are the number of employees, the hourly wage rate, the marginal physical productivity of water, the marginal price of water, and the percent of water recycled. Water used per bird is explained by an equation with two independent variables, Federal inspection and the hourly wage rate. Three production functions were used in analyzing the data. These were the Cobb-Douglas equation, the quadratic equation and the square root equation. It was found that 88 percent of the variation was explained in the quadratic equation and in the square root equation. Various combinations of independent variables were used to explain the variations in total volume of water withdrawn and in the volume of water used per bird in selected poultry processing plants. The presence of Federal inspection and the hourly wage rate were important factors correlated with variations in water used per bird. Contrary to the original hypothesis, the price of water was of little value in explaining variations in water used in the processing plants. (Conway-Ga Inst of Tech)

CONSERVATION: MINERALS IN SUBMERGED LANDS (LEASING OF STATE SUBMERGED LAND FOR MINING).

Del Code Ann tit 7, sec 6401-6440 (Supp 1966).

Descriptors: *Delaware, *Administrative agencies, *Leases, *Mining, Beds under water, Administrative decisions, Adjudication procedure, Legislation, Exploration, Exploitation, Oil, Natural gas, Sulfur, Permits, Surveys, Bids, Governors, Easements, Drilling, Negotiations, Royalties, Feasibility, Public rights, Regulation, Water pollution, State jurisdiction, Federal government, Insurance, Landfills, Rent, Shores, Seismic studies.
Identifiers: Delaware Water and Air Resources Commission.

The governor and the Water and Air Resources Commission are given the jurisdiction to lease state submerged lands for the purpose of mining oil, natural gas, sulphur, and other minerals. Definitions of terms used in the legislation are given. The Commission may grant permits for geological surveys of the submerged lands. The permittee is to follow regulations set out governing the permits. The Commission may examine the permittee's records but must keep them confidential. Before the Commission can lease lands it must hold a public hearing to determine the feasibility of the lease. The Commission must consider certain factors in deciding the feasibility of leasing. The lease gives exclusive drilling and mineral removal rights over a certain area. The lessee is to pay royalties and rents along with a performance bond. The Commission may permit different types of drilling and lease extensions. The lessee must protect against water pollution and upon termination of the lease may have to restore the property to its original condition. Certain schedules for drilling and production must be met. The Commission must consent to an assignment of the lease. The lessee may surrender the lease, or the state may cancel it upon certain circumstances. The Commission must follow certain bidding procedures. Successful bidders must comply with certain requirements before the execution of the lease. The Department of Defense must give prior approval to a lease. (Gadd-Fla)

CONSERVATION: MINERALS IN SUBMERGED LANDS (LEASING OF STATE SUBMERGED LAND FOR MINING).

Del Code Ann tit 7, sec 6401-6406 (Supp 1966).

Descriptors: *Delaware, *Administrative agencies, *Permits, *Beds under water, Leases, Exploration, Exploitation, Mining, Oil, Natural gas, Sulfur, Surveys, Administrative decisions, Shores, Adjudication procedure, Legislation, Regulation, Governors, Drilling, Seismic studies, State jurisdiction, Easements, Land, Subsurface investigations.
Identifiers: Delaware Water and Air Resources Commission.

The Governor and the Water and Air Resources Commission shall have jurisdiction to lease all submerged tide lands of this state. The leases are to be awarded for mineral exploration and exploitation. The Commission may not permit any interference, other than temporary interference, with the surface of the Atlantic shore. The Commission may, however, grant easements to portions of the surface of the Atlantic shore owned by the State to permit extraction of minerals. Lands administered by the Board of Game and Fish Commissioners cannot be leased by the Commission. Any person may apply to the Commission for a permit for making geological surveys on the tide and submerged lands of the state. The permit shall contain rules and regulations to protect natural resources. The permit will also limit the survey to specified lands. The permit is not exclusive and gives no preferential rights to any oil, gas, sulphur, or other mineral lease. A permit is not to exceed two years. The Commission may deny a permit on lands which would not be leased even if a lease were applied for. The Commission may require the permittee to make his survey records available to the Commission. Also the Commission may require as a condition to issuance of any lease that the lessee make available to the Commission all of his exploration records. The records from both the permittee and lessee are not to be disclosed. (Gadd-Fla)

CONSERVATION: MINERALS IN SUBMERGED LANDS (LEASING OF STATE SUBMERGED LAND FOR MINING).

Del Code Ann tit 7, sec 6407-6415 (Supp 1966).

Descriptors: *Delaware, *Administrative agencies, *Leases, *Beds under water, Bids, Feasibility, Public rights, Regulation, Drilling, Royalties, Rent, Administrative decisions, Legislation, Oil, Natural gas, Sulfur, Insurance, State jurisdiction, Water pollution, Shores, Land, Land tenure.
Identifiers: Delaware Water and Air Resources Commission.

The Water and Air Resources Commission shall hold a public hearing before lands are offered for leasing or upon an application for a lease. Notice of the hearing and the specific submerged lands under consideration is to be given to various state agencies, to the public, and to prospective applicants and bidders. The Commission may appoint an officer or employee to conduct the hearing. Any representative of the various state agencies served with notice of the hearing may question witnesses at the hearing. The Commission shall consider the feasibility of the lease considering the following factors: welfare of persons near the area of the lease; interference with recreational or residential areas; the esthetic and scenic value of the coast line; pollution; marine life; navigation; and drainage of minerals from state lands. A lease shall not be given for an area larger than six square miles. A lease shall grant the exclusive right to drill for and produce oil, gas, and other minerals. The lease extends for a primary term of ten years and for so long after the primary term as the lessee is producing or diligently attempting to produce. The Commission is to give a lease which requires at least 12 1/2% of gross production as a royalty. Also the Commission must specify a rent of at least $.25 an acre annually in the lease. The Commission may require insurance and performance bonds from the lessee as a condition to the lease. (Gadd-Fla)

WATER LAW--THE RISE AND FALL OF NEW MEXICO'S TEMPLETON DOCTRINE,
Timothy W. Glidden.
Natural Resources Journal, Vol 6, No 2, p 325-333, Apr 1966. 9 p.

Descriptors: *Surface-groundwater relationships, Judicial decisions, New Mexico, Prescriptive ights, Water transfer, Adjudication procedure, Relative rights, Water law, Legal aspects.
dentifiers: Impairment of existing rights.

The interrelationship of surface and groundwaters as long been an axiomatic concept in hydrology; he problem is incorporating the concept into the egal structure. Public waters in New Mexico are egulated under two outdated classifications-- roundwaters and surface waters. The surface-right older of a given amount of public water from a iven source has no means of replenishing his sur- ace supply when it is depleted. The Templeton ecision, which allowed Templeton to follow his urface right to its source by changing his point of iversion from a surface appropriation to a ground ppropriation, appeared to represent a reakthrough in New Mexico law. Subsequent cases revealed that Templeton was not a universal solution, primarily because of problems involving impairment of existing rights. The article urges that impairment problems created by transfers be faced squarely rather than avoided by eliminating the possibility of transfers. The legislature should recognize that transfers are necessary and possible under certain circumstances and should incor- porate that recognition into law. The results would ease the limitations on surface-right holders and contribute materially to revising the obsolete clas- sification of public waters. (Gossen-Chicago)

OUR NATION AND THE SEA (A PLAN FOR NATIONAL ACTION).
Committee on Marine Science, Engineering and Resources, Washington, D.C.

Report of the Comm on Marine Science, Engineer- ing and Resources, p 49-81, Jan 1969. 33 p, 3 tab, 3 fig.

Descriptors: *Coasts, *Federal government, *Oceans, *Management, Beaches, Coastal en- gineering, Coastal structures, Harbors, Law of the sea, International law, Shores, Fishing, Oil, Indus- tries, Exploration, State governments, Administra- tive agencies, Pollution, Pollution abatement, Pol- lution control, Costs, Manpower, Recreation, Wastes.
Identifiers: Coastal management system, Waste management.

To insure effective use of coastal areas, a sound management system must be devised that will give developmental alternatives, provide for proper planning and recognize the importance of this productive region. Coastal zone uses are varied and any management system must cope with all uses and rights. Uses of the coastal area are intensifying and moving seaward. Shoreline and offshore indus- trial uses demand that a management system deal with problems accompanying this movement. The Commission on Marine Science, Engineering and Resources recommends federal legislation to establish a coastal zone policy putting the manage- ment in federally funded state authorities. The authorities would be independent and would have sufficient power to accomplish their objectives. To protect national interests, actions would be subject to federal review. To establish a basis for decision making, continuing surveys and studies of the coastal zones must be made and data compiled. Ef- fective use of these zones demands coastal pollu- tion be abated and programs for achieving and maintaining water quality invoked. Such pollution programs must be in the context of and integrated with waste management in the entire environment. (Helwig-Fla)

THE COMMON LAW BACKGROUND OF THE RIPARIAN DOCTRINE,
T. E. Lauer.
Mo L Rev, Vol 28, No 1, p 60-107, Winter 1963. 48 p, 218 ref.

Descriptors: *Water law, Reasonable use, *Natural flow doctrine, *Riparian rights, Publications, Legal aspects, Water utilization, Diversion, Prior ap- propriation, Water rights, Riparian land, Water- courses (Legal), Public rights, Civil law.

A thorough presentation of the common law development of English water use law is made. The origin of the American doctrine of water use, whereby each owner of land upon the banks of a watercourse has a right to make a reasonable use of the water, is customarily placed shortly after the year 1825. This riparian doctrine has been ascribed to Joseph Story and James Kent. In the years fol- lowing 1825, the English courts were to abandon prior use and to embrace instead the natural flow doctrine. Then in 1851, the court of Exchequer adopted the American riparian doctrine with its basis of reasonable use. In 1825, the common law contained the seeds of the reasonable use test; the development across the centuries had been in the direction of a flexible standard enabling the greatest beneficial use of watercourses. Story and Kent, conversant with this common law background, drew heavily upon the Code Napoleon and Roman law in constructing the riparian doctrine. But, the continental legal system can be assigned only a paternal role. The gestation of the doctrine occurred within the matrix of the common law, over centuries of judicial experience and growth. A UNIFIED CABINET-LEVEL DEPARTMENT OF WATER DEVELOPMENT AND OPERATION HAVING FULLY COORDINATED FUNCTIONAL SERVICES TO MEET MODERN NEED. NATIONAL AND INTERNATIONAL,
Shu-t'ien Li.
Int'l Conference on Water for Peace, Washington: U.S. Government Printing Office, Vol 5, p 365- 371, 1967. 7 p. For 8 volume Proceedings see Vol 2, No 9, Field 6B, W69-03305.

Descriptors: *Water resources development, *Regulation, *Administration, Water allocation (Policy), Surveys, Research and development, Federal government, Political aspects, Social aspects, Interstate rivers, Watersheds (Basins), Publications, Institutions, Administrative agencies, Data collections, Conservation, Water supply, Waste-water (Pollution), Reclamation, Flood con- trol, Water pollution control, Hydrodynamics.

Government agencies for water development and operation can be most efficiently organized on the multi-phase principle of streamlined unification, coordinated functional services, optimum cen- tralization, and dynamic cooperation among all concerned. The basic framework of such an or- ganization is presented. The components of the proposed organization are: (1) national hydro-data service; (2) national hydro-conservation service; (3) national water supply service; (4) national waste-water sanitation service; (5) national recla- mation and flood control service; (6) national hydroelectric power service; (7) waterways, har- bors, and maritime administration; (8) water pollu- tion control administration; (9) interstate water ad- ministration; (10) international cooperation ad- ministration; (11) water development financing ad- ministration; (12) water research and development administration; and (13) wet space administration. It is submitted that only a unified cabinet-level de- partment of water development and operation may generate fully coordinated functional services to meet modern water needs of mankind. ROLE OF STATE GOVERNMENTS IN U. S. WATER MANAGEMENT,
Dwight F. Metzler.
Int'l Conference on Water for Peace, Washington: US Government Printing Office, Vol 5, p 402-407, 1967. 6 p.

Descriptors: *State government, *Water resources development, *Water policy, *Water allocation (Policy), State jurisdiction, Planning, Political aspects, Management, Social aspects, Regulation, Coordination, Water problems, Resource allocation, Water utilization, Water quality, Projects, Federal government, Administrative agencies, Flood control, Water control, Competing uses, Water rights, Withdrawal, Publications.

The primary responsibility for managing water rests with the states. This includes allocating water among competing uses, protecting rights to water, controlling withdrawals, preventing water pollution, and making water available to support the maximum economic development. The federal government has led in river basin planning and in the construction of large projects. The amount of state participation in meeting water needs varies widely. The most successful states have a strong program of: (1) basic data collection; (2) planning; (3) policy development; (4) implementing legislation; and (5) public education. The progressive states have provided leadership in solving their problems through strong financial support and by attracting staffs skilled in engineering, economics and law. They have developed an active partnership with both local units of government and the federal agencies. While the responsibility for policy making is not always centralized, it is clearly defined and carried out with close cooperation between the legislative and executive departments of state government. CONGRESS AND THE NATION'S WATER RESOURCES,
Walter Rogers.
ABA Section of Mineral and Natural Resources Law (1962 Proceedings), p 113-119, 1962. 7 p.

Descriptors: *Federal-state water rights conflicts, *State governments, *Federal Government, *Water rights, Political aspects, Local governments, Desert Land Act, Legislation, Public lands, Unappropriated water, Federal reclamation law, Water resources development, Navigable waters, Legal aspects, Governments.

The author discusses the problem of the federal government versus the state governments with reference to water rights. He discusses the historical background of the problem detailing the evolution of federal control over navigable waterways and federal activity in the area of flood control. Since World War II federal activity in the field of water resources has expanded to encompass virtually every phase of water resources development. The author then delves into the potential conflicts between state and federal government in respect to water rights. The fear in western states has arisen that the federal government proposed to take away without compensation, existing water rights secured under state law. Various congressional efforts to resolve the problem have been attempted and the author outlines these efforts. The author concludes with a plea to the legal profession to abandon the role of advocate of a position on the issue to study it objectively, and then to join with the Congress in finding a solution to the federal-state conflict over water. ALABAMA RIVER DEVELOPMENT AUTHORITY.
Ala Code tit 55 secs 373 (6f) - 373 (6j) (1960), as amended, (Supp 1967).

Descriptors: *Alabama, *Administrative agencies, *Water resources development, *River systems, Legislation, Regulation, Local governments, Administration, Coordination, Planning, Water policy, Water allocation (Policy), Rivers, Channels, Surveys, River basin development.

Alabama's water resources are of major importance for the industrial development and economic expansion of the state. To further these goals, the Alabama River Development Authority is created to develop the state rivers and waterways. The Alabama River Development Authority has the following powers and duties: (1) to contract with local governments in order to make studies and surveys of the state river system; (2) to investigate and make surveys of the state river system and to secure development of an inland waterway system; (3) to cooperate with local governments and organizations and to encourage efforts to secure development of state rivers; (4) to aid in securing federal legislation supporting river development and to secure federal funds; (5) to promulgate rules and regulations; and (6) to exercise such appropriate powers as will enable the accomplishment of the promotion, planning, and engineering of river and waterway development. Funds are appropriated to carry out the provisions of this article. (Childs-Fla)

Descriptors: *North Carolina, *Rivers, *Channel improvement, *Obstruction to flow, Legislation, Local governments, Regulation, Administrative agencies, Streams, Slopes, Dams, Fish passages, Gates, Mill dams, Lumbering, Bridges, Navigable waters, Fish guiding, Drainage ditches.

The Board of County Commissioners may appoint commissioners to perform various functions concerning rivers or streams running through the county. The commissioners shall clear and lay off rivers and creeks in their respective counties leaving three-fourths of such waters for the owners for erecting slopes, dams and stands and one-fourth for the passage of fish in such rivers or streams. The owner of any mill shall maintain a gate and slope to be used for floating logs. Any stream used to propel machinery which becomes diverted may be returned to its channel. Any person owning a boat plying any river or creek which might be considered non-navigable may make a draw in any bridge which obstructs passage. The Board of County Commissioners may establish public landings on any navigable stream or watercourse in the county. Obstructing free passage of boats along any river or creek is a misdemeanor. Lessening the natural flow of water along a natural water passage by obstruction is a misdemeanor. However, the erection of fish dams or hedges not extending across more than two-thirds of the width of any stream is lawful. The obstruction of streams and drainage ditches whereby the drainage is impeded is unlawful. (Childs-Fla)

Descriptors: *Mississippi, *Surface waters, *Relative rights, *Alteration of flow, Land tenure, Judicial decisions, Surface runoff, Surface drainage, Canals, Ditches, Drainage, Diversion structures, Water conveyance, Natural flow.

Complainant and defendant owned large tracts of adjacent land. Defendant's land was bounded on one side by an artificial canal. For years a natural watercourse flowed across complainant's land onto defendant's land and then turned naturally back onto other land of complainant. In 1912, the can and an artificial ditch were dug on defendant's lan diverting the natural water from its course. Th ditch continuously filled and overflowed despi defendant's efforts to keep it clear after his acquis tion of the land in 1941. Complainant claime damages from the natural water which had reverte to its original course and sought an injunction t force defendant to maintain the artificial ditch. C appeal from dismissal of the complaint, th Supreme Court of Mississippi held due to th topography of defendant's land, it would impos too great a burden upon him to require restoratio of the ditch. The court held an owner of land w not required to maintain artificial drains when ac of nature made it unreasonable or impossibl (Harris-Fla)

he county commissioners of any county may stablish levees or drainage districts and construct r improve ditches, canals, watercourses or pump- ig plants in order to drain and reclaim swam- lands. Whenever a majority of the landowners in a roposed district or owners of 3/5 of the land to be ffected by the proposed improvements petition to ie county court setting forth the location of the land and alleging that the land is too wet for cultivation and will be benefited by draining, ditching or leveeing and there is filed a bond in the amount of $50 per mile for such improvement, the clerk shall issue a summons to all non-signing landowners. Upon the return day the commissioners shall appoint a civil and drainage engineer and two freeholders of the county as a board of viewers to examine the lands and report thereon. The report shall set forth: whether the proposed drainage is practicable, whether it will be of benefit to the general welfare of the community or to a public highway, whether the benefit is sufficient to warrant the probable expenditure, and whether or not all the lands to be benefited are included in the proposed district. If the report is favorable the viewers shall be instructed to make a complete survey, draw plans, and estimate costs. If the report is unfavorable, the petition shall be dismissed. (Kahle-Fla)

DRAINAGE DISTRICTS.
Md Ann Code art 25 secs 100-107 (1957), as amended, (Supp 1968).

Descriptors: *Maryland, *Drainage districts, *Surveys, *Cost-benefit analysis, Assessments, Highways, Public benefits, Railroads, Legislation, Administrative agencies, Administrative decisions, Drainage programs, Ditches, Canals, Levees, Feasibility studies, Legal aspects, Maps.

The board of viewers shall make a complete survey of the proposed district marking the line of each ditch, drain or levee. A drainage map of the district shall be made showing the location of each improvement and the boundaries of each landowner. Locations of highways, railroads, and incorporated towns shall be set out. The viewers shall also assess damages to any landowners occasioned by the improvements. The benefited land shall be separated into 5 classes from highest benefit to least benefit to be used as a basis for assessment to the landowners. A final hearing shall be set for a date not less than 30 days after acceptance of the report by the commissioners. All non-signing landowners in the proposed district shall be summoned. At the final hearing any landowner may file a written objection to the viewers' report. If the commissioners find that the benefits to the land will outweigh the costs the district shall be established. If not the proceedings shall be dismissed at the cost of the petitioners. (Kahle-Fla)

DRAINAGE DISTRICTS.
Md Ann Code art 25 secs 108-117 (1957), as amended, (Supp 1968).

Descriptors: *Maryland, *Construction costs, *Assessments, *Drainage districts, Drainage programs, Administrative agencies, Highways, Cost-benefit analysis, State governments, Right-of-way, Drains, Laterals, Financing, Legislation, Costs, Local governments, Projects.

The county commissioners shall appoint three freeholders as the board of drainage commissioners for the established district. The board shall appoint a superintendent of construction and fix his compensation. The drainage commissioners shall ascertain and certify to the county commissioners the total construction costs and bond interest for a period of three years after construction. After the total costs are ascertained the drainage commissioners shall prepare assessment lists for each landowner to cover the period of the bond issue that will finance the project. If any highway or other public property is to be benefited the state shall be assessed for its share of benefits. Lands within the district not benefited shall not be assessed. Rights-of-way for drainage may be aquired by purchase or condemnation. Assessed landowners shall have the right to use the ditch or drain as an outlet for lateral drains. (Kahle-Fla)

DRAINAGE DISTRICTS.
Md Ann Code art 25 secs 118-122 (1957), as amended, (Supp 1968).

Descriptors: *Maryland, *Construction, *Construction costs, *Drainage districts, Drainage programs, Contracts, Federal government, Loans, Maintenance, Repairing, Assessments, State governments, Local governments, Administrative agencies, Costs, Legislation, Financing, Bids.
Identifiers: Negligence.

The board of drainage commissioners shall advertise for construction bids to be let to the lowest responsible bidder. Whenever an improvement is completed it shall be the duty of the drainage commissioners to maintain and repair the improvement and assess the benefited lands. If repairs are made necessary by the negligence of a particular landowner, he shall be assessed and his lands levied against for the repair costs. The drainage districts are authorized to avail themselves of any federal loan provisions for the operation of drainage districts that may be enacted, but no such agreements between the federal government and the drainage districts shall be valid until a majority of landowners in the district have given written approval to the contract. The 'Drainage District Fund' is established and $10,000 is appropriated from the treasury to this fund for loans not to exceed $2,000 to any one district for expenses incurred up to the time of the establishment of the drainage district. LAW ON THE POTOMAC RIVER.

Md Ann Code art 66C secs 306 thru 313 (1957).

Descriptors: *Maryland, *Commercial fishing, *Permits, *Regulation, Fish, Oysters, Crabs, Fyke nets, Gill nets, Nets, Fishing gear, Fish conservation, Navigable waters, Taxes, Legislation, Herring, Jurisdiction, Legal aspects, Virginia, State jurisdiction.
Identifiers: *Potomac River, Shad, Penalties (Civil), Penalties (Criminal).

Citizens of Maryland and Virginia who have been residents for 12 months may take fish, oysters, and crabs from the Potomac River upon compliance with Maryland law. Any citizen fishing for market or profit with pound, fyke, gill, sturgeon or skirt nets, haul seines, weirs or other devices, must obtain a seasonal license from an authorized Maryland officer and pay a prescribed tax. Officers have the right and duty to examine the right of persons taking catches, and may pursue and arrest violators of Maryland law outside the jurisdiction on navigable waters. Offenses may be punished by magistrates or Maryland courts of criminal jurisdiction. The use of certain sizes and types of nets is absolutely prohibited. The use of floating or drift nets or stake gill nets is prohibited except during shad and herring season in designated counties. The failure of persons to comply, or officers to enforce the laws of Maryland shall be punishable by fine and/or forfeiture of equipment as designated in the act. (Harris-Fla)

BOARD OF LEVEE COMM'N V WINEMAN (EMINENT DOMAIN PROCEEDINGS).

222 So 2d 683-685 (Miss 1969).

Descriptors: *Mississippi, *Levees, *Eminent domain, *Administrative decisions, Administrative agencies, Legal aspects, Judicial decisions, Easements, Condemnation, Legislation, Soil structure, Construction, Regulation, Berms, Engineering, Land tenure, Drainage, Excavation, Subsurface waters, Mineral industry, Floods, Flood control, Water management (Applied), Real property.

Plaintiffs had taken fee simple title to defendants' land by eminent domain. The land was taken in order to obtain soil to be used in improving and enlarging levees and for the construction of berm for reinforcement of the levee. Defendants sought to have the taking of fee simple title declared void and only an easement granted. Plaintiffs declared the taking of fee simple title to be of public necessity. The lower court held there was no public necessity for taking fee simple title, but on appeal the supreme court held the plaintiffs had not exceeded their discretion and could take a fee simple title. The court held that any administrative decision by the board would be upheld unless it was shown to be a manifest abuse of their discretion. In this case the evidence showed that the taking of fee simple title was a necessary increment to the efficient operation of the levee. The court found that the plaintiffs had not abused their discretion and could take fee simple title to the land. (Shevin-Fla)

OYSTERS.
Del Code Ann tit 7, secs 2101-2110 (Supp 1966).

Descriptors: *Delaware, *Oysters, *Commercial shellfish, *Regulation, Administrative agencies, Legislation, Water law, Water policy, Commercial fishing, Shellfish, Boundaries (Property), Ownership of beds, Riparian waters, Water rights, Preferences (Water rights), Legal aspects, Jurisdiction, Permits, Beds under water, Riparian rights.
Identifiers: Culling, Limits, Licenses.

One must purchase an appropriate license to take oysters in Delaware, but even with a license it is considered larceny to take oysters from the bottom or plantation of another. Oysters may not be taken at night. Plant and seed oysters taken in tributaries of the Delaware Bay must be culled and thrown back where they are caught. Twenty-five bushels per day is the limit on oysters in such waters and enforcement officials may board any boat taking oysters for inspection of such limit and to see that oysters are properly culled. Oysters may be planted in certain areas if the owner of such beds marks them with stakes. Another method of obtaining exclusive rights to oyster on a bed is to lease the bed from the state. (Johnson-Fla)

HIGHWAYS: (HIGHWAYS, ROADS, AND BRIDGES GENERALLY).

Del Code Ann tit 17, secs 504, 511 (1953), as amended, (Supp 1966).

Descriptors: *Delaware, *Drainage, *Flood control, Drainage systems, Ditches, Drains, Streams, Creeks, Culverts, Sewers, Damages, Jurisdiction, Flood protection, Water control, Channel improvement, Bridges, Administrative agencies, Legislation.

The Highway Department may maintain free passage of water for the drainage of any road, bridge, or causeway under its jurisdiction. To accomplish this objective, the Department may enter lands adjacent to a road or causeway for the maintenance or repair of any drainage system. Damages sustained by the owner of the adjacent land as a result of Road Department action are to be adjusted by agreement between the Department and the owner or by the Court of Common Pleas. Provisions regarding the wilful or negligent damage to any public bridge or drain, or any appurtenance maintained and used for the convenience or safety of the public are set forth. The injuring party is to forfeit and pay double damages. The action for damages is to be brought in the name of the state with all money being paid to the state treasurer. (Moulder-Fla)

STATE DAMS, RESERVOIRS AND OTH WATER CONSERVATION PROJECTS.

NH Rev Stat Ann secs 481.4-481.10 (1968).

Descriptors: *New Hampshire, *Administrative agencies, *Projects, *Water conservation, Judicial decisions, Administration, Legislation, Legal aspects, Water law, Political aspects, Water policy, Contract administration, Contracts, Economics, Eminent domain, Regulation, Financing, Jurisdiction.

The corporation is managed by five directors with special restrictions as to political affiliation and salary. The corporation has the general powers of New Hampshire Corporations and may accept cooperation from the United States or its agencies. The board, before commencing any project, must submit a detailed description and plan to the governor and council for their approval. Upon an order from the governor and council directing the board to proceed with a project, the board shall complete contracts with such persons or corporations as may be specially benefitted by such projects, including users of water in and outside the state for power and other purposes, covering terms under which such persons or corporations shall pay for such benefits. There is provision for a judicial determination in the superior court of reasonable compensation for such use when either a user declines to enter into such a contract or where the parties cannot agree on the amount of compensation for such use. The corporation may purchase or otherwise acquire for just compensation such real property as is necessary for a project. (Johnson-Fla)
W69-09606

STATE DAMS, RESERVOIRS AND OTHER WATER CONSERVATION PROJECTS.
NH Rev Stat Ann secs 481:11-481:14-a (1968).

Descriptors: *New Hampshire, *Local governments, *Water policy, *Water conservation, Legislation, Legal aspects, Water law, Contracts, Water utilization, Reasonable use, Riparian rights, Administration, Administrative agencies, Riparian land, Flow control, Flood control, Flow rates, Water control, Reservoirs, Economics, Taxes, Government finance, Judicial decisions, Jurisdiction.

When the corporation fails to agree with a municipal government on the appropriate relocation of a highway, bridge, electric transmission or distribution line, it may institute proceedings in the county superior court which will order such arrangements as justice may require. It is unlawful for any person to willfully use 'stored water' for power or other purposes, if he is not entitled to its use by contract. It is also unlawful for any person to willfully interfere with the flow of any stored water except as is necessary in making reasonable use of such water under contract or decree or incident to the reasonable use of the natural flow in the exercise of rights as a riparian or littoral proprietor. The corporation regulates the storage and release of water from each reservoir in an attempt to minimize damages from floods and to promote the state's economic and industrial welfare. All property rights acquired by the corporation are exempt from all taxation, but the corporation will make payments to each town from which property rights were acquired equal to the current local tax rate on such property. (Johnson-Fla)
W69-09607

STATE DAMS, RESERVOIRS AND OTHER WATER CONSERVATION PROJECTS.
NH Rev Stat Ann secs 481:15-481:21 (1968).

Descriptors: *New Hampshire, *Administrative agencies, *Financing, *Governments, Local governments, Federal government, Legislation, Water law, Water policy, Legal aspects, Political aspects, Jurisdiction, Judicial proceedings, Investment, Interstate compacts, Public health, Water conservation, Flow control, Flowmeters, Gages.

By resolution, the board may authorize the issuance of bonds for the purpose of paying the cost of any such projects as it may sponsor. Such bonds are payable only from the revenue of the corporation and are not a debt of the state or any of its political subdivisions. In the event that the corporation defaults in payment of principal or interest on any of its bonds a receiver is appointed to gather necessary assets of the corporation and to make payments to bondholders. The governor with the advice and consent of the council may in the name of the state guarantee the principal and/or interest of any bonds issued by the corporation. In a similar manner the governor may enter into agreements or compacts with other New England states for the purpose of promoting public health and safety by conserving and regulating river flow, lessening flood damage and preventing pollution. The board cooperates with the United States Geological Survey in the establishment and maintenance of stream flow gauging stations for informational purposes. (Johnson-Fla)

COASTAL FISHERIES LAWS.
SC Code Ann secs 28-752 thru 28-761 (1962), as amended, (Supp 1968).

Descriptors: *South Carolina, *Fishing, *Regulation, *Public rights, Fish, Bays, Rivers, Streams, Marshes, Leases, Legislation, Legal aspects, Permits, Ownership of beds, Beds, Tidal waters, Saline water, Fish conservation, Saline water fish, Administrative agencies.

All waters and tideland bottoms of bays, rivers, creeks, and marshes in the state or within three miles of the coast shall remain as a common to the people for fishing. This does not include waters and bottoms previously conveyed by the state. Minimum sizes of various fish to be bought and sold are established. It is unlawful to use edible fish except for food or bait. The South Carolina Water Resources Commission may prescribe regulations and require permits for all fishing. No lessee of a bottom may mark his leased area with a sign without the Commission's authority. A natural-born citizen with a sheriff's operator certificate must be aboard any shrimping or fishing boats while in operation. The statute sets forth penalties for violations. These provisions do not apply to fish or fishing in fresh waters. (Breeze-Fla)
W69-09609

FOLEY V STATE (DAMAGES FOR ELIMINATION OF WATER SUPPLY).
299 NYS 2d 864-866 (1969).

Descriptors: *New York, *Water supply, *Irrigated land, *Appropriation, Irrigation, Damages, Land appraisal, Land classification, Land use, Condemnation value, Water costs, Water loss, Judicial decisions, Legal aspects, Water law, State governments, Water resources, Water sources, Property values, Land.

An appropriation of lands for highway purposes by the state eliminated the water supply source, derived from an old gravel pit, which served to irrigate some 39.74 acres of claimants' lands. The court of claims awarded damages to claimants, and the state appealed. In the lower court claimants' appraiser attributed $1000 to the loss of the water supply, but he also depreciated the value of the 39.74 acres by $25 per acre or $990 because of the loss of irrigation. The appraiser subsequently admitted that the $1000 item represented the estimated cost of a new water supply and that the $990 item only represented the factor of the loss of irrigation. The supreme court held that this cost-to-cure estimate was duplicative of the depreciation item and had to be deducted from the total award. (Carruthers-Fla)
W69-09610

MOREY V STATE (LIABILITY FOR HIGHWAY CHANGE OF GRADE).
297 NYS 2d 820-825 (NY App Div 1969).

Descriptors: *New York, *Surface runoff, *Artificial watercourses, *Highways, Highway relocation, Damages, Road construction, Grading, Appropriation, Channeling, Judicial decisions, Legislation, Overflow, Eminent domain.
Identifiers: *Negligence.

Damages were sought against the state for their negligent construction of a highway grade and the appropriation of claimant's land. The state re-constructed a highway in front of claimant's property. In changing the highway grade water and dirt was caused to flow onto claimant's property and into his building's basement. The lower court awarded $3500.00 based upon the de facto appropriation of claimant's land. The appellate division reversed the lower court indicating that claimant failed to state a cause of action. It was not proven that the reconstructed highway was negligently constructed. The court said that the state is not liable for damages for change of grade unless a specific statute permits recovery or artificial channeling promotes and directs the flow of water. No evidence showed such artificial channeling and the claim for appropriation was not accompanied with substantial proof. (Holt-Fla)
W69-09611

STATE AUTHORITIES EMINENT DOMAIN ACT.

SC Code Ann, secs 25-52, 25-53, 25-64 (1962).

Descriptors: *South Carolina, *Eminent domain, *Riparian rights, Real property, Condemnation value, Condemnation, Powerplants, Dams, Canals, Locks, Reservoirs, Reclamation, Swamps, Reforestation, Watersheds (Basins), Public benefits, Easements, Right-of-way, Legislation, Water rights, Damages, Hydroelectric plants.

All state authorities are empowered: to develop waterways of the state; to construct and maintain powerhouses, dams, canals, locks and reservoirs; to reclaim and drain swamps and flood lands; to improve health conditions; and to reforest water sheds shall have the right of eminent domain. The right of condemnation shall include the right to acquire land and water rights for the above purposes. Unless otherwise indicated all property taken will be subject to the owner's right of ingress and egress. If the state does not utilize condemned property for the above purposes within 5 years then the former owner shall have the right to repurchase and recover damages. All lands previously acquired for public purposes are subject to this chapter. Questions of compensation and special damages shall be determined in accordance with prevailing principles of law. Public electric utility property, however, shall be condemned only if it is to be incorporated with a proposed electric utility. (Holt-Fla)

KOCIAN V DEVITO (IMPLIED WARRANTY IN DIGGING WELL).
5 Conn Cir 399, 251 A2d 516-519 (1968).

Descriptors: *Connecticut, *Contracts, *Artesian wells, *Damages, Wells, Drilling, Negotiations, Legal aspects, Judicial decisions, Remedies, Consumptive use, Potable water, Water yield, Relative rights, Water quality, Water wells.

Plaintiff, an artesian well-drilling contractor, brought suit to recover the balance due for services and materials furnished to defendants in fulfilling three contracts to dig wells. The first two wells had produced water of either insufficient quantity or unsatisfactory quality. The third well produced water adequate in both quantity and quality. The trial court awarded damages less than the balance due because in its opinion, the parties seemed to contemplate some sort of negotiated settlement since the first two wells were unsatisfactory. Plaintiff appealed. The appellate court set aside the judgment and remanded with directions to award

to plaintiff the full balance due. Absent any guarantee by the driller, there is no implied warranty as to the quality or quantity of the water a well might produce. No evidence was presented to show plaintiff made any such guarantees. Even if the trial court accepted defendants' testimony that there was some vague mention of compromise, no actual discussion of compromise even took place and there was no agreement to reduce any prices due. (Gabrielson-Fla)
W69-09613

AALSBURG V CASHION (ALLOCATING ACCRETION AMONG RIPARIAN OWNERS).
165 NW 2nd 309-314 (Ct App Mich 1969).

Descriptors: *Michigan, *Boundaries (Property), *Accretion (Legal aspects), *Lake shores, Lakes, Shores, Riparian rights, Judicial decisions, Remedies, Legal aspects, Relative rights, Riparian land.

Plaintiffs, defendants, and third party defendants all owned adjoining lots fronting on a lake. Over the years the water level of the lake had gone down causing substantial accretion in front of these lots. The court was asked to determine the property lines between plaintiffs' and defendants' premises and between defendants' and the third party defendants' premises in relation to this accreted land. The trial court determined that up through 1942 the parties acquiesed in an extention of their side lot lines in setting common boundaries over accreted lands. The courts extended these boundaries from the 1942 shoreline to the imaginary center point of the lake. Plaintiff appealed. The appellate court ruled that there was insufficient evidence to permit a finding of acquiescence to extending the side lot lines to the 1942 shoreline. It ruled that the accretion could be properly allocated by finding the original side lot lines nearest the disputed property, extending those lines to the new shoreline and then in a straight line to the center of the lake, and by dividing the new shoreline within those lines in direct proportion to the front footage of the original lots. (Gabrielson-Fla)
W69-09614

FARNES V LANE (RIGHTS INCLUDED IN AN EASEMENT).
161 NW 2d 297-301 (Minn 1968).

Descriptors: *Minnesota, *Ri parian rights, *Easements, *Legal aspects, Judicial decisions, Right-of-way, Docks, Lake shores, Boating, Recreation, Land use, Severance, Relative rights, Access routes.

Plaintiff, a lake shore landowner, sought a declaration that defendant's right-of-way over the plaintiff's lakeshore property provided access to the lake only. Defendant claimed that his right-of-way entitled him to build a dock, moor a boat, and store equipment beside the dock. The Supreme Court of Minnesota sent the suit back for a new trial saying that new evidence was needed to decide plaintiff's and defendant's rights. The court said that an easement was not an estate in land, and that an estate in land was needed before there could be riparian rights. Thus the defendant was not a riparian owner since he had no estate in land just the easement. But the court stated that a grantee of an easement might have the right to install a dock, moor a boat, and store equipment near the dock if he could show that the circumstances of the grant of the easement contemplated these rights. The court suggested certain questions to be answered at the new trial to determine if the disputed rights were included in the easement. (Gadd-Fla)

MUNICIPAL AND COUNTY GOVERNMENT (WATER WORKS).
Vt Stat Ann tit 24, secs 3301-3316 (1959).

Descriptors: *Vermont, *Water supply, *Water works, *Water distribution (Applied), Legislation, Regulation, Pipelines, Artesian wells, Reservoirs, Water rights, Utilities, Equipment, Water control, Water rates, Aqueducts, Water contracts, Water allocation (Policy), Water utilization, Cities, Public utilities, Financing.

A municipal corporation is authorized to construct, maintain and repair artesian wells, reservoirs, pumps, engines and apparatus and to purchase or acquire, any artesian wells, ponds, springs, streams, watercourses, real estate, water rights, flowage rights, and easements necessary to provide a water supply. For these purposes, the corporation may enter upon and use any land to lay and repair aqueducts and pipes. Agreement as to just compensation may be entered into with respective property owners. In lieu of agrement, the matter may be set before a board constituted by the court of chancery, which shall assess and award just damages. Any person who uses the water provided by the municipal corporation shall be required to pay. Any person who diverts the water, bathes therein, injures or destroys any artesian well, dam, embankment, aqueduct, pipe reservoir, conduit, hydrant, structure pump or other machinery held, owned, or used by such municipal corporation shall be liable to said corporation for treble damages. Said municipal water corporation may issue bonds and may establish water rates, the moneys received to be used t o pay the interest upon the water bonds of the corporations. The money received from the operation of the municipal water department shall not be used for any other purpose until all such bonds have been paid. (Moulder-Fla)

ppellants conveyed a portion of their property to ie Millard Wright, appellee's predecessor in title. ortly after the original conveyance a fence was nstructed along the south bank of a creek which n between the two tracts of land. Appellants con- nded this fence was meant to be a boundary di- der. Wright denied this, claiming that appellants ere to share the cost of construction and that a ater gate was to be built across the creek. In 1959, right conveyed the land to the appellees reserv- g one-half the mineral rights for himself. estimony showed that appellants had cleared the rth bank but that nothing had been done to the uth bank. The trial court found the fence was one convenience and not a boundary fence. The undary line was determined to be the thread of e creek and this appeal followed. The supreme urt affirmed, holding that the under the deed title tended to the middle of the creek. The court ated that the burden of proof of showing that a fferent boundary line than that described in t he ed was intended was on the appellant and that his rden was not met. The court determined that the nce was built as close to the natural barrier as ssible and had not become a boundary line by quiescence. The court also discounted appel- lant's claim that he had acquired the property by adverse possession. (Shevin-Fla)

DRAINAGE DISTRICTS IN CONNECTION WITH UNITED STATES LEVEES.

Iowa Code Ann secs 466.1 to 466.8 (1949).

Descriptors: *Iowa, *Levees, *Cost sharing, *United States, Financing, Navigable waters, Navigable rivers, Construction, Maintenance costs, Drainage districts, Right-of-way, Public health, Drainage systems, Administrative agencies, Construction costs, Assessments legislation, Boundaries (Property).
Identifiers: State boundaries.

Where the United States has built or shall build a levee on a navigable stream forming an Iowa boundary, the county board of supervisors shall have the power to aid in procurring the right of way for and maintaining said levee and providing an internal drainage system to complement the levee construction. Improvements shall be presumed to be conducive to public health. Any United States levee may be considered by the board as a part of the plan for any levee or drainage district and such board may agree with the United States to share in the cost of procurring the right of way and maintenance of such levee. The engineer shall set forth the cost of constructing and maintaining the cooperative levee. If a drainage district is established, all costs incurred under this chapter shall be assessed and collected from lands lying within such district. The annual amount collected for maintenance shall not exceed 12 1/2 mills per dollar of the assessed valuation unless the same is petitioned for in the manner required for the inauguration of new work. (Holt-Fla)
W69-09629

TRUSTEE MANAGEMENT OF DRAINAGE OR LEVEE DISTRICTS.

Iowa Code Ann secs 462.1 to 462.41 (1949), as amended, (Supp 1969).

Descriptors: *Iowa, *Levees, *Local governments, *Drainage districts, Political aspects, Condemnation, Right-of-way, Eminent domain, Ditches, Drainage, Multiple-purpose projects, Controlled drainage, Legislation, Leases, Settling basins, Mississippi River, Legal aspects, Administrative agencies, Water management (Applied).

Elected trustees are authorized to exercise the power formerly conferred on the boards of supervisors for the control, management, and supervision of drainage and levee districts. The authority of such trustees includes the power to acquire lands by conveyance, lease, or condemnation for rights-of-way for levees, ditches, and settling basins and to annex lands to the district. Specific provisions dictate the manner of election of trustees, the qualifications of trustees, the levee or drainage districts which are entitled to trustee control, how a district can petition for an election of trustees, and how a trustee district can petition to be placed back under the management of a board of supervisors. BRIDGES OVER STATE BOUNDARY LINE STREAMS.
Iowa Code Ann secs 309.84-309.92 (1949).

Descriptors: *Iowa, *Bridge construction, *Cost sharing, *Interstate rivers, Interstate compacts, Administrative agencies, Cost allocation, Boundaries (Property), Streams, State governments, Cities, Public utilities, Public rights, Taxes, Legislation, Costs, Legal aspects, Local governments.

Bridges on county line roads may by agreement be located, constructed, and maintained by one county to insure a proper site and to avoid unnecessary expense. Work and expense shall be shared by the counties. On petition of 10% of the legal voters of a county bordering a stream which forms a state boundary, an election may be had to determine whether the public favors construction of a foot or wagon bridge across said stream. The question shall be submitted at general election after public notice. If a majority of the voters favor a bridge, the board may agree with an adjoining state, or any municipal division thereof, as to allocation of cost and maintenance. The board may tax property in the county and issue bonds to finance the bridge. Such bridge may be used by public utilities under conditions agreed upon by the constructing and maintaining authorities, but no such use shall interfere with the public use. (Harris-Fla)
W69-09634

CONSTRUCTION AND MAINTENANCE OF BRIDGES AND CULVERTS.
Iowa Code Ann secs 309.67 - 309.83 (1949), as amended, (Supp 1969).

Descriptors: *Bridge construction, *Culverts, *Maintenance, *Iowa, Bridges, Administrative agencies, State governments, Federal government, Construction costs, Cost sharing, Maintenance costs, Repairing, Sluices, Design standards, Structures, Cities, Surface drainage, Bridge design, Cooperation, Legal aspects, Local governments.

The county board of supervisors and the county engineer are responsible for keeping bridges and culverts of the secondary road system open. Boards of supervisors of adjoining counties are required to divide the responsibility and cost of construction and maintenance of bridges and culverts found along county boundary lines. Board plans for the construction of bridges are subject to the approval of the state highway commission. If the intracounty boards fail to adequately cooperate, the state highway commission may render a binding allocation of responsibility. If the intracounty boards fail to comply with the commission's decision, the commission may proceed with the necessary construction or maintenance and bill costs to the respective counties. Similar provisions relate to bridges and culverts located along city-county boundaries. The terms 'culvert' and 'bridge' are defined, and maximum amounts for construction of intracounty and intercounty bridges are set. State specifications must be adhered to in bridge construction. WATER POLITICS IN MISSISSIPPI: A COMPARATIVE ANALYSIS OF TWO WATER RESOURCE DEVELOPMENT ORGANIZATIONS,
Mississippi State Univ., State College. Social Science Research Center.
A. R. Jones, and H. M. McLeskey.
Completion Report, Mississippi Water Resources Research Institute, July 1969. 34 p, 2 tab, 2 fig, 6 ref. OWRR Project A-031-MISS.

Descriptors: *Social aspects, *Organizations, Promotion, *Political aspects, Institutions, State governments, Water resources development.

Activities of two large-scale water resource promotional organizations are compared to determine strategies used by each to secure project funding. Activities are analyzed in terms of the history of each organization and its relationships to local publics, the Corps of Engineers, Bureau of the Budget, and Congress. Data were derived from interviews with the Administrators of the two agencies, the Tennessee-Tombigbee Waterway Development Authority (TTWDA), and the Pat Harrison Waterway District (PHWD), and review of organizational records. The findings were: (1) The two organizations are different in purpose and have different images; (2) TTWDA has had to 'sell' its project in view of a marginal economic classification while PHWD's efforts have been supported by relatively high benefit-cost ratios and a comprehensive development plan; (3) TTWDA has created a base of organized support (decentralized representation) in contrast to the centralized pattern of agency representation characteristic of PHWD; (4) In the context of their past histories and current relationships to Congress both organizations are 'successful' in that Congressional authorization and appropriations have, to some degree, been achieved for their respective projects.

GAME AND FISH COMMISSION.

Ark Stat Ann secs 47-101 thru 47-134 (1964).

Descriptors: *Arkansas, *Conservation, *Fish conservation, *Administrative agencies, Legislation, State governments, Federal government, Financing, Fish management, Regulation, Permits, Water conservation, Fish harvest, Fish farming.

The control, management, restoration, conservation and regulation of fish is vested in the Arkansas State Game and Fish Commission. The Commission has the exclusive power and authority to issue licenses and permits, provide catch limits, establish fishing zones and seasons, and provide penalties for violations. The Commission shall adopt ways to conserve and propagate fish, and to regulate fish propagation by private individuals. The Commission is authorized to cooperate with agencies of the United States government to further conservation and protection of wildlife. Game wardens and other employees shall be appointed to enforce Commission regulations. The Commission may apply to the state land commission for the use of state lands suitable for fish and game refuges. The fees or funds arising from the Commission activities shall be used to further the conservation goals of the Commission. The state of Arkansas assents to the congressional act designed to aid the states with fish restoration and management. (Darragh-Fla)

FISHING AND HUNTING LICENSES.
Ark Stat Ann secs 47-208 thru 47-210, 47-213, 47-215, 47-217 thru 47-223 (1964), as amended, (Supp 1967).

Descriptors: *Arkansas, *Permits, *Fish management, *Wildlife management, Legislation, Legal aspects, Regulation, Fishing, Fish conservation, Administration, Administrative agencies, Wildlife conservation.
Identifiers: *Penalties (Criminal), *Fishing permits.

A fishing license is required if fish are to be taken by specified methods. Certain classes of persons require special licenses, certain persons are exempt, and certain persons cannot obtain a license. Licenses are of no effect during closed seasons. Criminal penalties are set forth for non-compliance with any of the foregoing provisions. The cost of each type of license is set forth and it is provided that a specified portion of all license fees will go to the Arkansas Game and Fish Commission. Similar provisions apply to the taking of game. (Keith-Fla)

TITLE TO LAND ABOVE THE HIGH WATER MARK.

Ark Stat Ann secs 10-201 thru 10-207 (1956).

Descriptors: *Arkansas, *Alluvium, *Accretion (Legal aspects), *Riparian land, Legislation, Legal aspects, Riparian rights, High water mark, Navigable waters, Non-navigable waters, Beds, Streams, Lakes, Surveys, Boundaries (Property), Ownership of beds, Relative rights, Channels.
Identifiers: *Ownership of alluvium.

The state must institute suits to recover any forgotten, lost, or other outstanding public interest in property or to quiet title to any lands to which the state may claim title. All land which has formed or may hereafter form in the navigable waters of the state and within the original boundaries of a former owner of land along such stream shall belong to such former owner or his successors in interest. Title to all lands which have formed or may hereafter form in the beds of non-navigable lakes or in abandoned river channels or beds, whether or not still navigable, which are above ordinary high-water mark will vest in the riparian owners of said lands. The commissioner of state lands issues deeds to such lands upon application by such riparian owners after a proper survey has been made. (Keith-Fla)

INTERSTATE COMPACTS.

Ark Stat Ann secs 76-2101 thru 76-2104 (1958).

Descriptors: *Arkansas, *Interstate compacts, *Interstate commissions, *Bridges, Bridge construction, Legislation, Legal aspects, Mississippi, Mississippi River, Operation and maintenance, Construction, Planning, Eminent domain, Easements, Surveys, Administrative agencies.
Identifiers: Ferries, Property acquisition.

A proposal is made by the state of Arkansas that it enter into an interstate compact with Mississippi for the formation of an Arkansas-Mississippi Bridge Commission. The purpose of such a commission would be the planning, construction, maintenance, and operation of a bridge at a specified location over the Mississippi River. The Commission would have power to: purchase and operate all ferries across the Mississippi River within twenty-five miles of the bridge site; contract; sue and be sued; acquire and dispose of property; and exercise the power of eminent domain. Specifically provided for are the financing of the bridge, rates of tolls, record keeping, and administration of the Commission. (Keith-Fla)

NSTITUTIONAL ISSUES IN GAS AND OIL: ANALOGY,
vin Pitch.
ssiz Center for Water Studies Research Report, 1, No 2, 1968. 17 p, 49 ref.

criptors: *Foreign countries, *Governments, ter resources development, *Regulation, l aspects, Oil, Natural gas, Legislation, Conation, Pipelines, Water allocation (Policy), er pollution, Export, Proration, Political cts, Marketing, Water utilization, Natural urces, Political constraints, Interstate urces development.
tifiers: Canada, Federal-provincial conflicts, stitutional issues.

anada the development of oil and natural gas caused a conflict between dominion and incial legislation regulating this development. conflict has raised constitutional issues which ld be very similar to those raised if there was a lict over regulation of water resources elopment. The common areas of conflict would egulation of interprovincial trade, regulation conservation and regulation of the transporta- of the natural resources. Under the Canadian stitution provincial legislation controlling price upply in interprovincial trade is illegal unless control was incident to a valid provincial in-st. Thus provincial legislation concerning conation of natural resources which indirectly con-ed price or supply might be permissible. islation preventing 'physical waste' would be a l state interest, but legislation preventing nomic waste' would be questioned as uncon-tional. Legislation such as proration of produc- or export permits which might indirectly affect e or supply would probably stand a better nce of surviving a constitutional challenge if it for prevention of physical waste rather than nomic waste. Also provincial regulation of the sportation facilities for natural resources may constitutional questions. If the facilities such ipelines, motor carriers or pumping stations on ral watercourses were not connected with in-rovincial facilities or construction efforts the lation would stand. (Gadd-Fla)

cts of Water Resources Law in Minnesota, Jun , Bulletin 2, p 1-142. 142 p, 258 ref.

riptors: *Minnesota, *Water resources lopment, *Judicial decisions, Legislation, ral government, State governments, Local rnments, Administration, Administrative cies, Permits, Water rights, Hydrologic cts, Water allocation (Policy), Water conser-n, Water control, Watercourses (Legal), r demand, Water management (Applied), r pollution, Water law, Legal aspects.

mpilation of state court decisions includes ses of decisions regarding: classification of s; rights in natural surface watercourses; in diffused surface waters; rights in natural d waters; rights in artificial watercourses; riptive rights; obstruction and diversion; er and assignment of water rights; and water quality. The compilation of state and local statutes presented includes analysis of statutes dealing with: the permit system; mining and the drainage and diversion of water; county and judicial drainage systems; dams and lake water levels, irrigation, pollution control; fish management; topographic and geological surveys; water-borne transportation; water-safety laws; state and federal-state planning; joint control of interstate waters; regulatory programs; water policies of the state; and the numerous administrative bodies responsible for the foregoing. Certain aspects of federal statutes and Supreme Court decisions are analyzed with regard to the role of the federal government and conflicts of federal-state jurisdiction. Conclusions and recommendations are made in light of the foregoing analyses. An appendix contains an unofficial compilation of statutes dealing with water and related land resources passed by the 1969 state legislature. (Keith-Fla)
W69-09794

STATE JUDICIAL CLASSIFICATIONS OF WATER AND STATE JUDICIAL DETERMINATION OF RIGHTS IN NATURAL SURFACE WATERCOURSES,
Minnesota Univ., Minneapolis. Water Resources Research Center.
Raymond A. Haik, William C. Walton, and David L. Hills.
Aspects of Water Resources Law in Minnesota, Jun 1969, Bulletin 2, p 4-22. 18 p, 78 ref.

Descriptors: *Minnesota, *Classification, *Judicial decisions, *Water rights, Legal aspects, Water law, Riparian rights, Natural streams, Reasonable use, Appropriation, Public rights, Surface waters, Subsurface waters, Surface runoff, Confined water, Water utilization, Water users, Priorities, Navigable waters, Ownership of beds, Percolating water.

The state judiciary has set up two systems of water classification. The systems used to determine respective private rights distinguishes between waters on the surface of the earth and waters under the surface of the earth. Water on the surface of the earth is defined to include diffused surface waters, natural watercourses, natural bodies of water, and artificial surface watercourses. Water under the surface of the earth is defined to include underground waters in definite streams, underground percolating waters, and artesian waters. Each subclassification is defined. The system used to resolve private-public use conflicts distinguishes between public and private waters; private water is defined as diffused surface water and public water includes all of the other foregoing subclassifications. By way of contrast, hydrologic classifications are discussed. The state judiciary has adopted part of the appropriation doctrine and part of the riparian doctrine for use in determination of rights in natural surface watercourses. Cases dealing with the following are analyzed in light of these two doctrines: reasonable use theory; users of water; priorities as to competing uses; navigable waters; ownership of watercourses, beds and overlying waters; and legal differences with respect to streams, lakes, ponds, and watercourses. (Keith-Fla)
W69-09795

STATE JUDICIAL DETERMINATION OF RIGHTS RELATIVE TO DIFFUSED SURFACE WATERS, NATURAL GROUND WATERS, ARTIFICIAL WATERCOURSES, AND OTHER COMMON LAW PRINCIPLES,
Minnesota Univ., Minneapolis. Water Resources Research Center.
Raymond A. Haik, William C. Walton, and David L. Hills.
Aspects of Water Resources Law in Minnesota, Bulletin 2, Jun 1969, p 22-37. 15 p, 68 ref.

Descriptors: *Minnesota, *Judicial decisions, *Reasonable use, *Relative rights, Surface runoff, Repulsion (Legal aspects), Cities, Remedies, Artificial watercourses, Prescriptive rights, Obstruction to flow, Diversion, Riparian rights, Legislation, Water permits, Water pollution, Water rights, Water law, Legal aspects, Water users, Alteration of flow.

The state courts first used the common enemy doctrine in deciding disputes regarding diffused surface water. The courts now use the reasonable use doctrine in deciding such disputes and have laid down guidelines for its application. The state courts have rejected the absolute ownership rule and correlative rights doctrine in determining relative rights to natural ground waters; the reasonable use doctrine is used instead. Although no state court has decided a case involving relative rights in artificial watercourses, the courts' tendency to treat artificial watercourses substantially the same as natural ones indicates that the courts will apply the reasonable use doctrine to artificial watercourses. The circumstances under which the courts have held for prescriptive rights with respect to riparian owners on altered natural watercourses and owners of land on which diffused surface waters are discharged are set forth. The circumstances under which obstruction and diversion are permitted and prohibited by the courts are discussed. The courts have ruled that riparian rights may be assigned to non-riparian owners, but it is noted that the statutory permit system has largely abrogated such rulings. Remedies for private and public pollution are discussed. (Keith-Fla)
W69-09796

ASPECTS OF STATE STATUTES I,
Minnesota Univ., Minneapolis. Water Resources Research Center.
Raymond A. Haik, William C. Walton, and David L. Hills.
Aspects of Water Resources Law in Minnesota, Jun 1969, Bulletin, p 39-51. 12 p, 34 ref.

Descriptors: *Minnesota, *Legislation, *Water conservation, *Water resources development, Water law, Judicial decisions, Administrative agencies, Water permits, Water allocation (Policy), Mining, Drainage, Diversion, Construction, Maintenance, Dams, Drainage districts, Pollution, Irrigation programs, Legal aspects, Regulation, Water pollution control, Drainage systems, Water levels, Programs.

A compilation of state statutes dealing with water law is presented. Each statute is accompanied by a discussion of how it does or may affect the corresponding common law dealing with water law. General charge and control over the waters of the state and of their disposition is given to the Commissioner of Conservation. He is given the power to devise and develop a general water resources conservation program for the state, which program shall contemplate the conservation, allocation, and development of all the waters of the state for the best interests of the people. The state permit system in theory adopts an appropriation concept, but in practice relies heavily on common law concepts to regulate waters. A water resources board is authorized in order to provide a forum for resolution of conflicting public interests. Permits for drainage, diversion, control, or use of water can be granted when necessary for mining. County boards and district courts are authorized to construct and maintain public drainage systems. Dams and lake water levels are specifically regulated. Drainage, conservancy, and watershed districts are authorized, and their powers and responsibilities are enumerated. Irrigation is regulated. Pollution is heavily regulated and several agencies police its regulation. (Keith-Fla)
W69-09797

ASPECTS OF STATE STATUTES II,
Minnesota Univ., Minneapolis. Water Resources Research Center.
Raymond A. Haik, William C. Walton, and David L. Hills.
Aspects of Water Resources Law in Minnesota, Jun 1969, Bulletin 2, p 51-77. 26 p, 23 ref.

Descriptors: *Minnesota, *Legislation, *Water resources development, *Administrative agencies, Geological surveys, Soil conservation, Legal aspects, Structures, Harbors, Port authorities, Planning, Multiple-purpose projects, Coordination, Great Lakes, Treaties, Water policy, Regulation, Project planning.

The powers of the State Board of Health with regard to the enforcing of specified water law statutes are enumerated. Topographic and geological surveys are authorized. The powers of soil conservation districts and the Game and Fish Commission relative to water law are listed. Water-borne transportation and facilities therefore are provided for and regulated. County sheriffs are charged with the responsibility of enforcing water safety laws. Numerous administrative agencies are charged with the coordination, planning, and carrying out of varied water-related programs. The compacts, agreements, and treaties resulting from the state bordering on the Great Lakes are all noted briefly. The policies of the state with regard to water and water-related problems are enumerated as abstracted from policy declarations and the state laws. Provision is made for mandatory coordination and cooperation of all agencies and other organizations dealing with water and related land resources. (Keith-Fla)

ASPECTS OF FEDERAL STATUTES AND SUPREME COURT DECISIONS,
Minnesota Univ., Minneapolis. Water Resources Research Center.
Raymond A. Haik, William C. Walton, and David L. Hills.
Aspects of Water Resources Law in Minnesota, Jun 1969, Bulletin 2, p 79-96. 17 p, 47 ref.

Descriptors: *Minnesota, *Federal government, *Legislation, *Judicial decisions, Water law, Legal aspects, Administrative agencies, Flood control, Water resources development, Multiple-purpose projects, Recreation, Water pollution, Federal jurisdiction, Federal-state water rights conflicts, State jurisdiction, Federal project policy.
Identifiers: *Federal policy, Constitutional authority.

A discussion of the federal government's impact on the field of water law begins with a consideration of the constitutional authority for federal participation and their historical entry into the field. An analysis of the role of federal government includes discussions of federal cases and statutes, defines the jurisdiction of the federal government, and makes the point that federal regulations control over state law in case of conflict. Separate discussions explore the expanding role of the federal government in the areas of flood control, water resources development, multiple-purpose water resource development projects, water pollution, and recreational use of water. Two discussions center around criticisms aimed at the federal government: its forcing of the states to bypass their existing governmental units because of federal financial incentives, and its failure to require integration of efforts under a comprehensive plan covering all involved governmental units and agencies. A discussion of conflicts of federal-state jurisdiction begins by pointing out that by looking at 'jurisdiction' in the sense of 'power to act', the federal government is shown to have almost unlimited jurisdiction over water. While the need for a national water resources policy is conceded, methods for resolving conflicts are proposed. (Keith-Fla)
W69-09799

CONCLUSIONS AND RECOMMENDATIONS,
Minnesota Univ., Minneapolis. Water Resources Research Center.
Raymond A. Haik, William C. Walton, and David L. Hills.
Aspects of Water Resources Law in Minnesota, Jun 1969, Bulletin 2, p 97-105. 8 p.

Descriptors: *Minnesota, *Water resources development, *Water law, *Administrative agencies, Federal government, Legislation, Judicial decisions, Coordination, Irrigation, Irrigation permits, Hydrologic data, Water permits, Diversion, Water transfer, Watershed management, Water rights, Legal aspects, Classification, Flood control.
Identifiers: *Federal policy, *State policy, Cooperation.

To increase the working efficiency of the numerous organizations participating in water resources activities carried on within the state, responsibility for comprehensive coordination and cooperation should be centralized; efforts to achieve this goal have thus far proved unfruitful. The state's combined common law and statutory scheme for determination of relative rights with respect to water use is well adapted t o the needs of the state. The state's irrigation policy should be based on hydrologic conditions. The water permit system should allow for controlled transfers and diversions of water from one watershed to another. The permit system needs modification to reduce the uncertainty of water rights, and to provide definite criteria for permit granting. The present legal classification of water should be replaced by hydrologic classifications. The state should take greater responsibility in the area of flood control. Congress should curtail the extent to which the federal government exercises its powers in the area of water resources and should give states and localities a stronger voice in federal programs. (Keith-Fla)

STATE V MANNING (ACTION FOR TRESPASS ON A LAKE).

165 SE 2d 13-15 (NC Ct App 1969).

Descriptors: *North Carolina, *Lakes, *Recreation, *Leases, Judicial decisions, Legal aspects, Fishing, Hunting, Dams, Ponds, Waterflow, Riparian land, Riparian waters, Recreation facilities, Water resources development, Riparian rights, Land tenure.
Identifiers: Trespass, Penalties (Criminal).

The defendants were charged with trespassing on a lake which was posted with 'no trespassing' signs. The lake had been developed by a corporation formed to build a dam to create the lake. The corporation was a private club whose members had fishing privileges in the lake. The club leased all the property surrounding the lake, including the lake itself. The defendants were arrested pursuant to a request by the club president. The court stated that it was irrelevant whether the lake was a 'private pond' because that factor had no bearing on the trespass statute. The court held that the trespass statute would only authorize arrests incident to the consent of the owners. The court further stated that a lessee is not an owner under the law, and therefore the club could not supply the necessary consent for the arrest of the defendants. The court granted the defendants' motion for a nonsuit. (Shevin-Fla)

COASTAL FISHERIES LAWS (FISH A GAME).

SC Code Ann secs 28-770 thru 28-991 (1962 amended, (Supp 1968).

Descriptors: *South Carolina, *Commercial f ing, *Fish, *Fish conservation, Commercial f Legislation, Regulation, Shellfish, Commer shellfish, Oysters, Shrimp, Crabs, Clams, management, Fisheries, Fish handling facili Saline water fish, Ownership of beds, Beds un water, Leases.
Identifiers: *Bed limits and dimension.

South Carolina may regulate coastal fishing wi the territorial jurisdiction of the waters of the st Special regulations apply to oyster, shrimp, cr and clam cultivation, harvest, and processing. C tain geographical areas are delineated in wh shrimp trawling will be allowed, depending on season. Regulations are specified concerning taking of blue crabs, including the geograph areas and seasons for harvest. The geograph areas and seasons during which shad and sturg may be taken are delineated. Portions of bot land owned by the state may be leased for the pose of commercial oyster culture, not to exc one thousand acres to any one person for lon than five years. Regulatory provisions for non-f fish and for the use and construction of seines nets in general as well as penalties, licensing, taxing provisions applicable to all fish gathe from state waters are provided. Included in th provisions are shrimp and crab boat licen pealers and processors licenses, non-food fish f ing licenses, wholesaler and power boat licen and shipping certificate provisions. STATE CONSERVATION COMMISSION.

Iowa Code Ann secs 107.28-107.34 (Supp 1969).

Descriptors: *Iowa, *Conservation, *Recreation facilities, *Watershed management, Legislation, Administrative agencies, Federal government, Project planning, Fish conservation, Financing, Project purposes, Public benefits, Recreation, Watersheds (Basins).
Identifiers: *Conservation commission.

The state conservation commission is hereby authorized to perform such acts as may be necessary to the conduct and establishment of cooperative fish restoration projects in compliance with federal acts and regulations. The commission is also authorized to perform such acts as may be necessary to conduct and establish cooperative outdoor recreational and watershed facilities as may be defined by the Congress of the United States and may accept federal funds for such projects. The state and its subdivisions should enjoy the benefits of federal assistance programs for the planning and development of outdoor recreation resources. The commission is authorized to prepare, maintain, and keep up-to-date a comprehensive plan for the development of the outdoor recreation resources of the state and to acquire lands, waters, and interests in lands and waters for such areas. The commission may apply for funds from any appropriate federal agency. (Heckerling-Fla)

FISH AND GAME CONSERVATION.

Iowa Ann Code secs 109.99-109.101, 109.105 (1949), as amended, (Supp 1969).

Descriptors: *Iowa, *Mussels, *Regulation, Legislation, Mississippi River, Missouri River, Administrative agencies, Baits, Bait fishing, Administration, Shellfish, Fish management, Fish harvest, Permits.
Identifiers: Des Moines River.

It is unlawful to take, catch, or kill mussels for commercial purposes without first procurring a mussel license. Mussels may be taken from the Mississippi and Missouri rivers at any time and may be taken from designated portions of the Red Cedar, Iowa, and Des Moines rivers between June 15 and November 30, of each year. All other state waters are closed. Manufacturers of pearl buttons or fish bait may possess mussels lawfully taken, and a licensed fisherman may take mussels to be used by him for bait or food. All holders of mussel licenses must report before April 1 of each year to the Fish and Game Commission the weight of his catch, where they were taken, and the amount received for the shells. (Holt-Fla)

COMMERCIAL FISHING.

Iowa Code Ann secs 109.106-109.120 (1949), as amended, (Supp 1969), sec 109.121 (Supp 1969).

Descriptors: *Iowa, *Fish conservation, *Commercial fishing, *Fishing gear, Catfishes, Mississippi River, Missouri River, Regulation, Nets, Tributaries, Legislation, Water policy, Minnows, Administrative agencies, Administration.

Except for taking minnows or as otherwise provided, it is unlawful to take fish by seines or other devices. The use of seines and other devices for catching fish is restricted in tributaries emptying into the Mississippi. All seines and other devices for taking fish must be properly licensed. Fish salesmen may not possess catfish under 13 inches. The size of mesh or seines and the sizes of other fish-taking devices are controlled. Enumerated fish-taking devices may be used in the Mississippi and Missouri rivers, and designated fish may be taken therefrom. Certain fish species that meet minimum weight or length requirements may be taken from the Mississippi and Missouri rivers. Commercial fishermen may retail or wholesale their catches but all other salesmen must procure a license. Commercially licensed fishermen must annually report to the fish and game commission the amount of their catch and where and how their catch was taken. It is unlawful to market fish without first procuring a license. Records of the species and quantities of all fish taken from Iowa waters and handled by the licensee must be kept for each license year. Punishments are provided for violating the above provisions. SOUTH CAROLINA WILDLIFE RESOURCES DEPARTMENT.
SC Code Ann secs 28-93, 28-97, 28-100, 28-101, 28-104, 28-106, 28-107, 28-108 (1962), as amended (Supp 1968).

Descriptors: *South Carolina, *Wildlife conservation, *Commercial fishing, *Hunting, Sport fishing, Regulation, Administrative agencies, Legislation, Adjudication procedure, Permits, Taxes, Fish conservation, Shellfish, Commercial shellfish, Shrimp, Fish management.
Identifiers: Law enforcement.

The Wildlife Resources Commission is established as a branch of the Wildlife Resources Department. All functions of the commission shall be performed by the Division of Game and the Division of Commercial Fisheries. The Division of Game shall function to conserve game and enforce tax and license laws relating to game and private fishing. The Division of Commercial Fisheries shall embrace the conservation of shellfish and commercial fishing and the execution of license and tax laws pertaining thereto; provided that the enforcement of such laws shall be performed by the Division of Game. The Division of Commercial Fisheries shall consist of a director, skilled in the conservation of commercial fishing resources, and such employees as may be necessary. The commission shall hold hearings in all matters relating to shellfish, shrimp, and commercial fishing. Appeals may be taken to the courts in all matters as were formerly appealable from the State Board of Fisheries. Authorized agents of the Wildlife Resources Department may conduct scientific investigations at the request of the directors of the Divisions of Game and Commercial Fisheries. The department may acquire land for the purpose of maintaining game and fish preserves. The commission shall have charge of state game wardens and supervise enforcement of state laws pertaining to game and fisheries. (Kahle-Fla)

STATE BOARD OF HEALTH; SHELLFISH.

17 SC Code Ann 250-253 (1962).

Descriptors: *South Carolina, *Commercial shellfish, *Environmental sanitation, *Permits, Interstate, Administrative agencies, Regulation, Legislation, Public health, State governments, Surveys, Inspection.
Identifiers: *Public Health Service, Packing, Shucking, Records.

Any person, firm, corporation or association shucking, packing or selling shellfish must first obtain and display a permit from the State Board of Health. In order to provide sanitary control of the shellfish industry, the state, industry, and the Public Health Service shall be responsible for certain procedures. The state shall regulate the industry and the regulatory authority shall inspect, survey and condemn growing areas and patrol restricted areas. The authority shall inspect plants, issue certificates to producers and dealers and supply records to the Public Health Service. The certificate holders shall place their certificate number on all packages of shellfish shipped in interstate commerce and keep records which may be inspected by the regulatory authority and the Health Service. The Health Service shall inspect and rate plants in each state and keep a list of authorized interstate shippers and publish the list for the use of consumer states. Statutory definitions given shall apply in the interpretation of the rules and regulations set forth for control of the industry. (Harris-Fla)

Identifiers: Family purpose doctrine, Watercraft

While swimming in a Georgia lake, a 16 year boy was run into and cut to death by a boat own by defendant and operated by his 13 year daughter. The boat was kept by defendant for comfort, pleasure and convenience of his fam The mother of the decedent brought a wron

th action alleging application of the family pur-
e doctrine and violation of a regulation promul-
ed by the State Game and Fish Commission stat-
that the owner of a watercraft shall be liable for
injury or damage occasioned by the negligent
ration of such watercraft. The lower court held
family purpose doctrine not applicable to boats
gave judgment for plaintiff. On appeal by de-
lant the appellate court reversed. On certiorari,
Georgia Supreme Court held that the family
pose doctrine is applicable to boats. The court
further that the Game and Fish Commission
eeded its delegated authority in adopting a rule
ivil liability between private citizens in that the
slature did not authorize the commission to
pt a rule rendering liable the owner of water-
t for their negligent operation. (Carruthers-

PORTSMOUTH-KITTERY BRIDGE.

NH Rev Stat Ann secs 258:2 thru 258:7 (1964).

Descriptors: *New Hampshire, *Interstate compacts, *Bridge construction, *Financing, Bridges, Administration, Legislation, Legal aspects, Water law, Federal government, State governments, Project planning, Costs, Local governments, Cost repayment, Political aspects, Bonding, Operation and maintenance.

The compact provides that the governor of New Hampshire shall appoint three residents of the state to be members of 'The Maine-New Hampshire Interstate Bridge Authority.' Such members then have to submit the compact for approval to the Congress of the United States. The Authority is incorporated under the laws of New Hampshire and has the powers necessary for the construction, operation, and maintenance of an interstate toll bridge between Portsmouth and Kittery. The Authority has power to issue negotiable bonds for the purpose of paying the costs of the bridge and its highway approaches, but such bonds do not constitute a debt of the state or any agency or political subdivision thereof. 13 Mich App 435, 164 NW 2d 533-539 (1968).

Descriptors: *Michigan, *Riparian rights, *Easements, *Landfills, Earthworks, Land forming, Lakes, Navigable waters, Bodies of water, Streams, Public land, Recreation, Boating, Riparian land, Legal aspects, Prescriptive rights, Water rights, Judicial decisions, Access routes, High water mark.
Identifiers: Prescriptive easements, Injunctions (Mandatory).

Plaintiffs were owners of land located on two navigable lakes which were connected by a stream. Defendants intended to improve by filling the property lying between the two lakes for commercial recreational purposes. The public had a right of ingress and egress by a prescriptive easement over the filled land to the lakes. Plaintiffs, as riparian owners and as members of the public sought a mandatory injunction against continued filling and an order to remove a portion of the fill. The trial court granted the relief and defendants appealed. The court found that evidence of both parties as to the area covered by the public easement coincided and held that the injunction issued covered more than this area. The injunction should have been limited to the areas over which the easements existed. The court also found that portions of the fill were on dryland above the ordinary highwater mark and did not interfere with the rights of riparian owners or the general public but provided better access to the lake and connecting stream. Defendants therefore did not have to remove this portion of the fill. (Helwig-Fla)

MARINE FISHERIES.

NH Rev Stat Ann secs 211:65-211:70 (Supp 1967).

Descriptors: *New Hampshire, *Marine fisheries, *Commercial fishing, *Sport fishing, Shellfish, Commercial shellfishing, Marine fish, Permits, Regulation, Administrative agencies, Legislation, Fish conservation, Fish management, Fisheries, Oysters, Crabs, Clams, Federal government, State governments, Costs, Administrative costs, Resource development, Grants.

A division of marine fisheries is established in the department of fish and game for the purpose of regulating and promoting recreational and commercial marine fishing. 'Marine fisheries' refers to the taking of salt-water fish, crabs, oysters, clams and clam worms. The division is authorized to receive and spend gifts and grants from any source and to hold property acquired for projects approved by the Secretary of the Interior for research and development of commercial fisheries resources. The director of the fish and game department shall supervise the division, authorize expenditures from the marine fisheries fund and may hold hearings and issue regulations as provided by statute. The director shall appoint a marine biologist as chief of the division. The director shall employ such other help as is necessary for the control of marine fisheries. He may, until a permanent marine biologist is appointed, employ a consultant to set up a program and to train biologists and other employees. Such consultant may be paid $6000 a year from the marine fisheries fund, but may not be employed for a period longer than two years. Money collected from licenses, fines for taking shellfish, and gifts shall be kept in a separate marine fisheries fund to be used for expenses of the division. (Kahle-Fla)

PROPAGATION OF FISH AND GAME.
NH Rev Stat Ann secs 212:1-212:33 (1964).

Descriptors: *New Hampshire, *Fish management, *Fish conservation, *Administrative agencies, Legislation, Water policy, Legal aspects, Fish establishment, Fish reproduction, Fish stocking, Regulation, Permits, Administration, Fishing, Wildlife, Federal government, Condemnation, Condemnation value, Compensation, Economics, Wildlife habitats, Habitat improvement, Fish populations.

The state may condemn lands or waters for protection and propagation of fish or for fishing or administrative purposes in the event that said properties cannot be purchased or leased at a reasonable price. If the owner is dissatisfied with the payment for such properties, he may appeal the award to the county superior court. The director of the fish and game commission in conjunction with the commissioner of agriculture may establish game refuges for the protection and propagation of fish on state fish and game lands, on privately owned lands with the consent of the owner and abutters, or on state or national forest lands. The director may remove or transfer fish and he may sell or exchange fish, eggs or fry with other states or individuals in the interest of protection or propagation thereof. The state consents to the federal act of Congress dealing with fish restoration and management projects and empowers the director to consent to cooperative fish restoration and management projects. Licenses are required for those engaging in private propagation of fish. A provision limits the liability of landowners allowing the public to use their lands free of charge for hunting and fishing. (Johnson-Fla)

LICENSES.
NH Rev Stat Ann secs 214:1-214:23, 214:30-214:37 (1964), as amended, (Supp 1967).

Descriptors: *New Hampshire, *Permits, *Regulation, *Freshwater fish, Control, Fishing, Fish, Legal aspects, Legislation, Water policy, Administration, Administrative agencies, State governments, Wildlife conservation, Fish management, Hunting, Smelts, Bait fishing, Baits, Bait traps, Minnows, Fishing gear.
Identifiers: *Licenses.

Before any person, resident or nonresident, may hunt, fish, or take in any manner wild animals, he must purchase a proper license which he must display on his outer garment when hunting or fishing. Members of the armed forces, minor children, and resident owners of farm lands (while fishing on their own property) are excepted from the licensing requirements. Licensees are categorized and each group pays a special fee for the type of license purchased. Any license so issued is revocable upon conviction of a violation of any provision of this chapter. Any person who violates the provisions against throwing refuse into public waters may, in addition to the penalty therefore, lose his fishing or hunting license for the current year. A bait dealer must purchase a license to sell freshwater smelt; such license also authorizes the taking of such smelt. Equipment used to take live bait must be clearly marked with the name of the owner and user. (Johnson-Fla)

BACK CHANNELS OF PORTSMOUTH HARBOR; SHORE AND BEACH PRESERVATION AND DEVELOPMENT.

NH Rev Stat Ann secs 216-C:1 thru 216-C:16 (Supp 1967), 217:1 (1964).

Descriptors: *New Hampshire, *Channel improvement, *Projects, *Harbors, Administrative agencies, Administrative decisions, Federal government, State governments, Federal project policy, Investigations, Erosion, Erosion control, Shores, Coasts, Currents (Water), Waves (Water), Boating, Recreation, Water sports, Cities, Federal budget, Damages, Construction, Engineering, Legislation, Water law, Legal aspects, United States, Appropriation, Cost allocation, Costs, Cost sharing.
Identifiers: Corps of Engineers.

The public works and highway department, through cooperative study and investigation with appropriate agencies of the United States government, shall attempt to devise effective means of erosion prevention relative to the coastal shores of this state. The governor is authorized to undertake, in cooperation with the Army Corps of Engineers, a project to improve the back channels of Portsmouth Harbor for small boating. In this regard, the governor is authorized to act for the city of Portsmouth and other public local interests. But, no action under this authority shall be taken except where federal funds are found to be available for such projects and where state expenditure is economically justified, the New Hampshire state port authority, with the approval of the governor, is authorized to cooperate and enter into such agreements with the federal government as are deemed advisable and to render such assurance as may be required to obtain such funds. It is anticipated that the Corps of Engineers will supervise the construction of the cooperative projects and that upon completion the federal government will maintain the dredged channels while the city of Portsmouth will operate and manage the public landings or wharves. Any contracts let for construction of the projects shall be administered by the commissioner of public works and highways. The department of public works and highways is authorized to cooperate in engineering studies with the Corps of Engineers. (Carruthers-Fla)

LAY OUT OF HIGHWAYS TO PUBLIC WATERS.

NH Rev Stat Ann secs 235:1 thru 235:9 (1964).

Descriptors: *New Hampshire, *Highways, *Access routes, Condemnation, Eminent domain, Damages, Appropriation, Condemnation value, Assessments, Reservoirs, Cost allocation, Costs, Cost sharing, Administrative agencies, Administrative decisions, Land tenure, Land use, Locating, Public rights, Public benefits, Compensation, Gates, Cities, Legal aspects, Legislation, Water resources, Water users.
Identifiers: Public waters.

Upon petition and hearing, the governor may determine the necessity for laying a highway access route from any existing highway to any public water in this state. The governor shall also determine its location and appoint a commission to purchase the necessary land and complete the lay out. The governor, upon petition, may appoint a commission to determine whether there is occasion for the laying out of such highway. Notice of any hearing entailed by this procedure shall be given to the first petitioner and to each affected property owner and to the clerk of any affected city or town. Damages sustained by each property owner shall be assessed by the commission, which shall also pay such damages and file a return, and in all matters pertaining to such layout shall have the same powers and duties as commissioners have in laying out class I or II highways. Any landowner aggrieved by the commission's damage assessment may appeal to the superior court and have his damages assessed by jury. Any such highway may be made subject to gates or bars across the same. No such highway shall be laid out to any public waters used by any city or town for reservoir purposes. The state shall pay such portion of the commissioner's services, damage awards and construction costs as the governor shall deem just and reasonable. Th balance shall be paid by the affected towns. Suc highway shall be deemed a class V highway. Tow or the state are not liable for any injury to person property on any such highway. (Carruthers-Fla)

scriptors: *Vermont, *Bridges, *Local governnts, *Repairing, Administrative agencies, gislation, Government finance, Cost allocation, gal aspects, Administration, Public benefits, intenance, Maintenance costs, Highways, Adnistrative decisions.

y three citizens may give written notice that a dge is in a state of disrepair to a selectman of the wn in which the bridge is located. If repair on h bridge is not begun within thirty-six hours, h citizens may file for a hearing with the road nmissioners and, upon proper notice, a hearing l be held to determine whether or not the public good demands the repair of such bridge. The commissioners may order repair to begin themselves or order the town to initiate such action within thirty days. If the town fails to initiate the proper repairs, the commissioners will appoint an agent who will immediately repair such bridge. The town is liable for payment of the costs of such repair. When a bridge is between two counties or towns, both towns are jointly liable for the repair and maintenance of such bridge. (Johnson-Fla)

WATER TERMINALS.

Ill Ann Stat ch 19, secs 146-149 (Smith-Hurd 1963), as amended, (Supp 1969).

Descriptors: *Illinois, *Railroads, *Water management (Applied), *Construction, Construction costs, Administrative agencies, Leases, Rates, Contracts, Legislation, Land use, State jurisdiction, Administration, Rates, Cost allocation, Repairs, Maintenance, Maintenance costs, Equipment, Legal aspects.
Identifiers: *Water terminals.

The Department of Public Works and Buildings is directed to improve certain water terminal premises in Cook County. Plans may be prepared and contracts let for said improvements by the Department. The Atchison, Topeka and Santa Fe Railway shall be liable for the costs of such improvements not exceeding an aggregate $200,000 under a prior contract. The Department may lease, for periods not exceeding 10 years, portions of the improved property to any financially responsible person or corporation. Such lessees must agree to satisfactorily maintain the facilities, to pay a reasonable rent, and, in the case of private lessees, to furnish a bond to insure performance of the lease. The Department may not sell any part or all of said terminals, but may sell obsolete, used or excess materials and apparatus of any kind. (Kahle-Fla)

300 NYS 2d 810-811 (1969).

Descriptors: *New York, *Bridges, *Boundary disputes, *Real property, Land tenure, Encroachment, Judicial decisions, Legal aspects, Relative rights, Water law.

Defendants were owners of a bridge and passageway which, as determined by the court, encroached upon plaintiff's property. The court ordered the bridge removed at defendant's expense. The defendants appealed. The appellate court held that the defendants could not use that portion of the bridge which encroached over plaintiff's property but reversed the lower court's ruling that the defendant must remove the bridge by further holding that the evidence as to ownership of the bridge was insufficient to prove that defendants owned it. Descriptors: *New Hampshire, *Administrative agencies, *Interstate compacts, *Interstate commissions, Legislation, Administration, Regulation, Water resources, Natural resources, State governments, Water policy, Dams, Flood control, Storage, Water resources development, Taxes.

New Hampshire enters into the Merrimack River Flood Control Compact with Massachusetts in order to promote interstate comity among and between the signatory states, to provide adequate storage capacity for impounding the waters of the Merrimack River and its tributaries, and to provide a joint and common agency through which the signatory states may effectively cooperate in accomplishing the object of flood control and water resource utilization in the Merrimack River basin. The Merrimack River Valley Flood Control Commission is created, the duties of which are enumerated herein. Agreements between New Hampshire and Massachusetts as to the sites of certain dams and reimbursement to New Hampshire by Massachusetts of lost tax moneys, economic losses, and damages occasioned by the provisions of the Compact, together with applicable procedural steps pertinent thereto are set forth. Compact notice and recording procedures as well as provisions for the appointment and compensation of flood control commissioners are set forth. (Moulder-Fla)

6G. Ecologic Impact of Water Development

WATER RESEARCH PROGRAMS - AQUATIC COMMUNITIES,
Academy of Natural Sciences, Philadelphia, Pa. Dept. of Limnology.
Ruth Patrick.
US Dep Interior, Office of Water Resources Res Rep, Mar 1968. 22 p, 9 ref. OWRR Contract No 14-01-0001-1569.

Descriptors: *Reviews, *Ecology, *Ecosystems, Food chains, Productivity, Eutrophication, Water pollution effects, Lakes, Streams, Estuaries.
Identifiers: Aquatic ecosystems.

The present state of knowledge about the structure and functioning of aquatic ecosystems and how nutrients and energy are cycled through them is reviewed, and programs of research in these subjects are discussed. Knowledge as to the effects of various types of pollution on these ecosystems is discussed. Fields of research which need to be pursued in order to understand the structure and functioning of aquatic ecosystems are outlined. The kinds of basic studies needed in order to understand the effects of various types of pollution or perturbation, and how they can be diagnosed are discussed. Ways in which research in this important field should be implemented are suggested. (Knapp-USGS)

7A. Network Design

DETERMINING RAIN GAUGE DENSITIES IN ENGLAND FROM LIMITED DATA TO GIVE A REQUIRED PRECISION FOR MONTHLY AREAL RAINFALL ESTIMATES,
Imperial Coll. of Science and Technology, London (England). Dept. of Civil Engineering.
P. H. Herbst, and Elizabeth M. Shaw.
J Inst Water Eng, Vol 23, No 4, p 218-230, June 1969. 13 p, 4 fig, 2 tab, 7 ref.

Descriptors: *Rain gages, *Network design, *Statistical methods, Rainfall-runoff relationships, Gaging stations, Hydrologic data, Regional analysis.
Identifiers: *United Kingdom, Rain gage network density.

In demonstrating the analysis of rainfall observations from rain gauge networks in an attempt to determine the optimum densities required for given conditions, the selection of a range of catchments from different parts of England has produced results that reflect the variability of the precipitation pattern. It is obvious that the several statistics do not fit easily into simple relationships. From the foregoing discussion of the results, it might be suggested that the study of required network densities might produce more conformable figures if done on a regional basis. A t test on the 5 in. monthly rainfall line at 2.5% precision indicates that, for the relationship of the required gauge density to the long-term areal averages, there is only a 2.5% chance of this occurring by chance. Once a rain-gauge network has been installed and reliable observations are assembled, then the standard techniques of analysis are carried out. When a few years of data are available, checks on the quality can be made and tentative estimates of the station standard annual averages can be evaluated. A greater density of gauges than indicated in this study would be essential to assess daily areal precipitation, and to ensure the measurement of intense local storms. (Knapp-USGS)

7B. Data Acquisition

PRODUCTION OF ISOLATED PAIRS OF WATER DROPS HAVING UNEQUAL RADII,
National Center for Atmospheric Research, Boulder, Colo.
Charles E. Abbott.
The Rev Sci Instrum, Vol 40, No 9, p 1227-1230, Sept 1969. 4 p, 5 fig, 6 ref.

Descriptors: *Instrumentation, *Rainfall simulators, *Artificial precipitation, *Simulated rainfall, Laboratory tests, Rain.
Identifiers: Water-drop pair production, Raindrop interaction.

To extend laboratory investigations of the effects of electric charges and fields on colliding water drops, a technique has been developed for simultaneously producing pairs of drops with unequal radii. Radius ratios as large as 10 to 1 can be obtained with drops having radii in the range 0.1-1 mm. Continuous production of drop pairs is possible, with the desired repetition rates selected by electronic controls and unwanted drop pairs deflected out of the observation volume. Successive pairs, thus produced, are sufficiently identical that a sequence of photographs has been obtained with an effective elapsed time between exposures of 100 microsec, the equivalent of 10,000 frames/sec in terms of high speed photography. John C. Angus, David L. Morrow, and John W. Dunning, Jr.
Ind Eng Chem, Vol 61, No 2, p 8-20, Feb 1969. 1 p, 14 fig, 1 tab, 112 ref.

Descriptors: *Laser, *Velocity meters, Measuring instruments, Light waves, Optical instruments, Motion, Bibliographies, Molecules, Laminar flow, Instrumentation, Fluid flow, *Flowmeters, *Flow measurement, Hydraulics, Physics, Vibrations.
Identifiers: Doppler effect, Light beams, Light scattering method, Brownian movement.

Velocity measurements may be made by detecting the Doppler shift of laser light scattered from

ving object. The paper discusses laser Doppler
ocity meters for measuring the motion of fluids
nacroscopic objects and methods for determin-
molecular motions. The most important present
lications include fluid flow measurements,
ration analysis, and transport property measure-
nts in fluids. Potential applications include mea-
ement of particle size distribution, chemical
ction rate constants, and velocity sensing for au-
atic control devices. The method may find
earch uses in crystal nucleation and growth stu-
s, emulsion polymerization, measurement of
ctra and correlation functions in turbulent flow,
studies of conformations of macromolecules in
ution. The method is accurate, almost instan-
eous, does not disturb the system being mea-
ed, has a high spatial resolution, and can mea-
e velocities as low as 0.001 cm/sec. (USBR)

ischarge measurement, Head loss, *Water mea-
ement, Energy losses, Hydraulics, Irrigation
als, Ditches, Parshall flumes, Comparative
efits, Canals, Unlined canals, Channels, Sub-
rgence, Slopes.
ntifiers: *Trapezoidal flumes, Submerged flow,
e flow, Lined canals, Rectangular channels.

pezoidal flumes are superior to rectangular or
rshall-type flumes for measuring small flows.
ese flumes can be constructed as an integral part
a lined canal or made of metal, fiberglass, or
od and installed in the channel. The shape con-
ms to the normal shape of lined or unlined
ches. The trapezoidal shape is desirable because
width of water surface increases as the depth in-
ases. This means that one structure can convey
rger range of flow; the entire range of depth for
iven range of discharge is smaller. Operational
aracteristics of trapezoidal flumes are superior
ause less backwater will result and a shallower
tion will be required than for a rectangular
pe. Another desirable feature of the trapezoidal
ne is the flat bottom throughout rather than a
pped section as in the Parshall flume. No par-
lar advantage of a crest section with a drop in
floor such as in the Parshall flume has been
nd. Submergence to a maximum of 80% can be
wed before corrections are necessary. For flows
h submergence in excess of 80%, flow cor-
tions can easily be made. The total head loss
ough the trapezoidal structure may be less for
nparable discharges than for the Parshall flume.

ntifiers: *Rocky Mountains, Fraser Experimen-
Forest, Colo.

diction and simulation of runoff from snowmelt
important to the economic and efficient opera-
of engineering systems supplying and con-
ing water. In 1964, the Forest Service initiated
ogram to collect snow cover data on a routine
s. Low-level air photos, supplemented by ground observations, were used to observe the areal extent of snow cover at about 10-day intervals after snow melt began. Results from 3 small watersheds in the Fraser Experimental Forest, Colo, are discussed. Each of the 3 watersheds has a characteristic functional relationship between the extent of snow cover during the melt season and accumulated runoff. Observed year-to-year deviations may have physical significance that can be explained by differences in initial snowpack water equivalent, soil moisture requirements, and meteorological conditions during snowmelt. Subjective interpretation of the photos may account for much of the scatter around mean curves. Importance of snow cover information in various streamflow forecasting methodologies justifies continued research to develop more objective techniques for accurately obtaining this type of information from aerial photographs. Several more years of record are needed so that the entire range of hydrologic conditions at various stages of snowpack depletion are sampled. (USBR)
W69-09539

A 2-YEAR EVALUATION OF THE SNOWMELT LYSIMETER,
Forest Service (USDA), Moscow, Idaho.
Harold F. Haupt.
Pap, 37th Annu Meet West Snow Conf, Salt Lake City, Utah, Apr 1969. 8 p, 4 fig, 2 tab, 6 ref.

Descriptors: *Lysimeters, Snow management, *Snowmelt, Snowpacks, Melt water, Rainfall, Runoff, Hydrologic instruments, Measuring instruments, Instrumentation, Runoff forecasting, Evaluation, Hydrology, Maintenance costs, Costs, *Snow.

The Forest Service operated a snowmelt lysimeter during the 1966-67 and 1967-68 winters at the Priest River Experimental Forest in northern Idaho. The lysimeter has a surface area of 2.72 sq ft and measures the outflow from the base of a column of undisturbed snow. Direct measurements are provided for melt output during clear weather and rain percolate plus melt during rainy periods; the lysimeter does not provide continuous assessment of snow input or water equivalent of the snowpack. The apparatus consists of a catchment trough with an outlet drain, an underground drain hose, and a catchment tank and recorder system. The operation of the installation is described and results are given. The lysimeter is low in construction and maintenance costs, is accurate, and there is practically no loss of records from malfunctions. (USBR)

TECHNIQUES OF HYDROLOGIC RESEARCH IN FORESTED PEATLANDS, U.S.A.,
Forest Service (USDA), Grand Rapids, Minn. North Central Forest Experiment Station.
Roger R. Bay.
XIV IUFRO Congress, Munich, Vol 1, p 400-415, 1967. 6 p, 4 fig, 4 tab, 19 ref.

Descriptors: *Bogs, *Swamps, *Instrumentation, *Watersheds (Basins), Water measurement, Demonstration watersheds, Hydrogeology, Water table, Streamflow, Stream gages, Forestry, Organic soils, Minnesota.
Identifiers: *Bog hydrology, *Peatlands, *Forested watersheds, Wetland hydrology.

The hydrology of bog watersheds in the northern United States is being studied with controlled field experiments utilizing the calibrated watershed approach. Although this technique has been used on upland and mountainous watersheds it has rarely if ever been used in studies of peatland hydrology. Research techniques and instrumentation have been modified or developed to cope with unusual problems in peatlands. Groundwater wells in the study bogs and hydrogeologic investigations on the surrounding watershed area have proven invaluable in the interpretation of bog water table fluctuations and bog groundwater relationships. During the pre-treatment period, precipitation, runoff, and groundwater data collected on six experimental bogs have already yielded important information on the hydrology of natural, forested bog watersheds. Laboratory and field experiments in organic soils have also provided new information on the physical properties of peat materials. Data on water retention and hydraulic conductivities of peats in situ have explained water table reactions to precipitation input and evapotranspiration output under natural conditions. These data should also help explain land treatment effects, and aid in the extension of hydrologic principles to other peatland complexes.

NEW TECHNIQUES OF RECLAMATION CONSTRUCTION,
Bureau of Reclamation, Denver, Colo.
B. P. Bellport.
Prepr 826, Amer Soc Civ Eng Annu Nat Meet Water Resour Eng, New Orleans, La, Feb 1969. 43 p, 9 fig.

Descriptors: *Construction, Creativity, Construction equipment, Earth handling equipment, Tunneling machines, Pumping plants, Aesthetics, Soil cement, Shafts (Excavations), Blasts, Excavation, Photogrammetry, Cross-sections, Tunnel construction, Aerial photography, Critical path method, Safety, Borehole cameras, Specifications, Value engineering.
Identifiers: Innovation, *Bureau of Reclamation, Radial jacking tests, *Construction methods, *Cost savings.

New techniques being employed in constructing Bureau of Reclamation structures and facilities in the 17 Western States are described. Some Bureau efforts for advancing the administration of construction contracts through improvements in specification provisions are discussed. New advances in construction safety and research activities that will influence developing new construction techniques are reviewed. In meeting future challenges, the engineering profession and construction industry must devise new construction techniques to accomplish work economically and expeditiously, and use their technologies and experience to provide an improved environment reflecting the relationship of man to his needs and the high standard of living enjoyed in this country. The reso
cefulness and skills of engineers and contract
will be challenged as water resources projects gr
in magnitude and complexity and as the Natio
needs for water continue to mount. (USBR)

Inflow-outflow measurement, Spacing.

Theoretical effects of joint spacing and of perfo
tions on flow into 1-ft lengths of drain tile
presented. Results show relative inflow rates
the effect on water table drawdown for 6-in.-
drains 4 ft deep. Field results show that
theoretical effect of joint spacing can be applied
the drawdown case if the water table midw
between the drains is at least 2 ft above the cen
of the drain tile. The studies also provided so
verification of the theory applicable to perfo
tions. Spacings of perforations on the cylindri
surface of a drain has little effect on inflow wh
the ratio of shortest to longest spacing is grea
than 0.2. Uniform spacing is recommended. Fr
data presented, the effect on water table drawdo
can be estimated for perforations or joints and
effect of a combination of joints and perforatio
can be approximated. A desired increase in fl
may be obtained by adding perforations or by
creasing the joint spacing on short lengths
drains. For a given drainage rate, depth, and dian
ter of drain, increasing the joint spacing (or p
forations) increases the drawdown rate. The eff
of joint spacing on drawdown rates increases as
drain spacing and soil porosity decrease. (USBR

Identifiers: Piezometric head, Canada, Press
cells, Leda clay, Ottawa sewer plant.

Measurements of surface settlement, changes
piezometric levels, and earth pressures were m
on a 10-ft-dia tunnel in Ottawa, Canada. The t
nel passes through extremely sensitive
moderately overconsolidated Leda clay. The
strumentation is described, and results are given
a period covering 1 yr before construction to
after completion. Results are compared with m
surements on a similar tunnel in Detroit clay. M
surements were made on a flexible temporary s
lining and on the rigid permanent reinfor
concrete lining. Very little surface settlement
measured because of overconsolidation in the
and the construction method. The tunnel acts
drainage sink and influences the piezome
regime in the clay. Earth pressures agreed
previous tunnel measurements, showing that ve

pressures approach the full overburden pres-
e. (USBR)

draulic model studies were conducted for a
posed armored overflow embankment of an af-
bay regulation dam on the Yuba River, Calif.
nning studies indicated that substantial
nomic advantages would result from using the
erflow embankment in lieu of a conventional
ncrete spillway. Armor protection for the crest
d downstream face will prevent surface erosion
the embankment during overtopping. Armor
tection for the apron, in conjunction with a high
tural tailwater, will prevent scour of the tailrace
annel at the toe of the dam during overtopping.
epage pressures that develop when the entire
charge occurs through the dam during periods of
novertopping streamflow are less than critical,
l will not produce flotation of material at the
wnstream toe of the dam. Seepage pressures in
embankment during periods of overtopping
charges are not excessive and will probably not
duce flotation of material near the downstream
e of the dam. Suitable gradation of materials
hin the zoned embankment will prohibit the in-
tion of piping at the interfaces of the zones.

ge pressure increases following rapid valve clo-
s in liquid flow pipe systems produce forces
must be resisted by the system structure. These
es produce pipeline motion, usually of small
plitude and generally ignored in water hammer
lysis. The motion may produce pressures that
er significantly from those predicted using
lly supported pipelines. Initial pressure surges having magnitudes greater than 20% above the commonly used maximum for instantaneous valve closure may result under certain combinations of structural parameters and closing conditions; subsequent surges can be much greater than the initial surge. Under other conditions, the pressure buildup is retarded significantly and the line motion can be used to control water hammer pressures. Line motion associated with water hammer surge can produce characteristics such as pressure overshoot and jagged portions of the pressure trace that have often been observed experimentally. (USBR)

DESIGN OF ROUGHNESS ELEMENTS FOR ENERGY DISSIPATION IN HIGHWAY DRAINAGE CHUTES,
Virginia Polytechnic Inst., Blacksburg.
Henry M. Morris.
Highw Res Rec, No 261, p 25-37, 1969. 13 p, 5 fig, 15 ref.

Descriptors: *Energy dissipation, *Roughness (Hydraulic), Field tests, *Chutes, *Channels, Channel flow, Hydraulic jump, Hydraulic design, Flow control, Turbulent flow, Spillways, Laboratory tests, Hydraulic models, Bibliographies, Roughness, Hydraulic structures, Stilling basins.
Identifiers: (Energy dissipators, Roughness projections, Chute blocks, Channel design, Spillway profiles, Critical velocity.

A recurring need in hydraulic engineering is a simple, reliable method for dissipating excess energy in storm water flowing down steep drainage channels. This problem has been handled by some form of stilling basin at the channel outlet. An alternate method is the provision of roughness elements in the channel. Such elements can be designed to produce the phenomenon of tumbling flow in the channel. This is a cyclically uniform flow consisting of a series of hydraulic jumps and overfalls, assuring that the channel outlet velocity will not exceed the known critical velocity for the given discharge. Laboratory and field studies have been conducted to develop design criteria for this method of energy dissipation. The study indicates that either 2-dimensional square elements or cubical elements should be used. Design equations and recommendations for spacing and placing elements are presented. (USBR)

A GUIDE TO THE GENERATION OF LIAPUNOV FUNCTIONS,
International Business Machines Corp., New York; and Princeton Univ., N.J.
Okan Gurel, and Leon Lapidus.
Ind Eng Chem, Vol 61, No 3, p 30-41, Mar 1969. 12 p, 1 fig, 1 tab, 69 ref.

Descriptors: Mathematics, *Mathematical analysis, *Differential equations, *Stability analysis, Dynamics, Reviews, Matrix algebra, Bibliographies, Transformations, Nonlinear systems, Optimization, Equations, *Control systems, Automatic control, Analytical techniques, Systems analysis.
Identifiers: *Liapunov theorem, Dynamic equilibrium, Eigenvalues.

Liapunov's direct method of stability analysis treats the stability of ordinary differential equations and tries to answer the question of whether the solution remains arbitrarily close to an equilibrium solution after being disturbed. The analysis is accomplished by the Liapunov function and its total derivative which is examined for certain properties. The theorems for Liapunov's method are discussed; methods for constructing the functions are described. Use of this method for analyzing a specific physical system requires in-depth searching of the literature in many diverse fields to ascertain recent developments. This paper enables a novice to approach the literature in a rational manner. (USBR)

WELL CAPACITY FOR CONTINUOUS PERMEABILITY VARIATION,
Northwestern Univ., Evanston, Ill., Technological Inst.; and Soil Testing Espanola, Madrid.
R. J. Krizek, W. H. Baker, and A. G. Franklin.
ASCE Proc, J Irrig and Drainage Div, Vol 95, No IR3, Pap 6785, p 409-414, Sept 1969. 6 p, 1 fig, 2 ref, append.

Descriptors: *Water wells, *Specific capacity, *Permeability, *Groundwater movement, *Mathematical studies, Model studies, Mathematical models, Drawdown, Flow, Porous media, Anisotropy, Artesian wells, Water yield.
Identifiers: Fracturing (Aquifers), Acid treatment (Aquifers).

The results of an analysis of the relative effects of continuous, radially symmetric permeability variations on the capacity of a single artesian well are graphically presented. Such variations may result from acid treatment, fracturing, effects incident to mud-drilling, or from structural alterations in soil adjacent to a well. The change in permeability was assumed to be maximum at the well face and to decrease exponentially in a radial direction away from the well axis. The resulting equation for relative well capacity was integrated numerically for various cases to yield a family of curves which, together with estimates of the altered and original permeability values and of the radial extent of the permeability change, can be used to quickly obtain estimates of well performance. Proceedings Vol 1 (Subject A) Thirteenth Congress of the International Association for Hydraulic Research, Kyoto, Japan, p A38-1--A38-8, Sep 1969. 8 p, 4 fig, 1 tab.

Descriptors: Unsteady flow, *Simulation, Rivers, Reservoirs, *Transient flow, Hydraulics, Computers, *Open channels, Waves, Field measurements.
Identifiers: *Stream channels, Turbine operations, Tennessee Valley, Water flow, *TVA.

During the past 2 years major advances have been made by TVA using the digital computer to solve the basic differential equations describing the transient behavior of water in open channels. TVA's mathematical model uses an explicit scheme to compute discharge, stage, and velocity transients from known boundary and initial conditions. In this scheme, finite difference representations of the differential equations of continuity and motion are solved. Stage, flow, or rating curve boundary conditions, local inflows, variable roughness along the channel, and actual channel geometry can be used. Steady or transient flows and stages along the channel may be given for initial conditions. Results from four studies show the diverse range over which the model has been applied. These are two reservoirs, a

natural river, and an uncontrolled canal connecting two reservoirs. Calculated results and field measurements are in excellent agreement in each of the four cases. Once verified the mathematical model becomes an invaluable tool for predicting the transient response to any type of operation.

BEHAVIOR OF TURBINE PUMPS OF HIGH POWER OR HIGH SPECIFIC SPEED DURING START-UP,
D. Florjancic, and D. Hartland.
Ver Deut Ing Ber Nr 75, p 27-36, 1964. Transl from Ger, Bur Reclam Transl 813, June 1969. 29 p, 20 fig.

Descriptors: *Pump turbines, *Hydraulic machinery, Pumps, Model tests, Hydraulic turbines, Compressed air, Turbine parts, Turbine runners, Model studies, Guide vanes, Investigations, Design, Foreign research, *Specific speed, Behavior.
Identifiers: Germany, Foreign testing, *Starting, Reversible turbines.

A survey of problems occurring during startup of reversible turbine pumps is given and procedures for limiting power input to the pump motor are described. Cause and magnitude of heavy alternating loads on guide vanes are described with reference to startup, emergency situations, and abnormal operating conditions. If water is depressed in a pump to reduce power consumption during startup, the greatest problems in power control occur as the pump is being rewatered. If adequate steps are not taken to control the movement of the increasing quantity of water in the pump, extremely rapid rise in power consumption can occur. The flow of water within a filling pump can be controlled by: (1) baffles designed to break up circular movements, (2) gates positioned between the suction tube and runner to prevent axial exchange-flow, (3) variation of the density of the medium by aerating, or (4) installation of turbulence jets to produce favorable flow characteristics in the suction tube. Measures to handle cases involving flow interruption during pumping or the transition from pump to turbine operation were considered. Results of model tests, suggestions for relieving startup problems, and the history of pump turbine technology are given. (USBR)

WASHING INSULATORS ON 500-KV LINES IS FOUND MOST EFFECTIVE,
Pacific Gas and Electric Co., San Francisco, Calif.
W. H. Zalabak.
Transm Distrib, Vol 21, No 5, pp 150-152, May 1969. 2 p, 4 fig.

Descriptors: *Power operation and maintenance, *Electrical insulators, *Contamination, Atmospheric pollution, *Transmission lines, Costs, Extra high voltage, Maintenance, Economies, High pressure, Safety.
Identifiers: *Live line maintenance, Contaminants, *Washing.

Experiences with transmission on the Pacific Gas and Electric Co system in California, indicated that the new 500-kv lines would require removal of insulator contamination, particularly true of installations in coastal areas where equipment is exposed to airborne salt and industrial contamination. Past experiences proved that energized line washing is the most economical method of removing contamination. Studies were made on the 500-kv lines in the Moss Landing area to determine whether washing or applying silicon grease would prove more economical. The study showed that over $200 per yr per tower could be saved by hotwashing. Rules covering the more critical points and several common sense rules were established for the safety of personnel when washing energized lines.

EFFECT OF SPECIFIC SPEED ON CENTRIFUGAL PUMP OPERATING CHARACTERISTICS,
Worthington Corp., Harrison, N.J.
Raymond A. Kugelman.
Water Wastes Eng, Vol 6, No 3, p B-24-B-27, Mar 1969. 4 p, 9 fig.

Descriptors: *Centrifugal pumps, *Pumps, Design, *Specific speed, Curves, Hydraulic machinery, Efficiencies, *Characteristics, Hydraulic design, Mixed flow pumps, Propeller pumps, Limiting factors, impellers, Pump testing.

Operating limitations of centrifugal pumps are occasionally dictated by the mechanical design. The prime reason for these limitations lies in the influence of the specific speed of the pump on operating conditions. The term specific speed does not refer to speed, but is an index number that classifies each pump. Specific speed establishes: (1) the shapes of the head-capacity, power-capacity, and efficiency-capacity curves; (2) the maximum efficiency that the pump will attain; and (3) the configuration of the impeller and all hydraulic passages. These characteristics determine the operating capabilities of the pump. Effects of specific speed on pump operating characteristics are discussed. (USBR)

PROBLEMS OF LARGE WATERWHEEL GENERATORS,
Westinghouse Electric Corp., East Pittsburgh, Pa.
E. C. Whitney.
Pap, Amer Power Conf, Chicago, Ill, Apr 1969. 4 p.

Descriptors: *Electric generators, *Hydroelectric power, Design, *Electrical design, Stators, Rotors, Thrust bearings, Thermal expansion, Magnetic fields, Manufacturing, Faults (Electrical), Electric relays, Temperature, Centrifugal forces, Erection, Maintenance, Handling equipment, Excitation, Voltage regulators, *Generators.
Identifiers: *Electric machinery, Air gaps, Protection (Electrical), Temperature rise.

Future problems likely to be encountered in designing and constructing large waterwheel generators are discussed, using as a guide the past experience gained from manufacturing machines rated 220,000 kva/261,000 hp, 225 rpm, 60 deg C rise, and designing 615,385-kva machines. On any large generator having a rotor diameter in excess of 50 ft, thermal expansion of the stator and rotor must be controlled so that the stator will remain concentric with the rotor, even though the time sequence of expansion of the stator is not the same as for the rotor. The magnetic pull in large machines may cause buckling of the stator punchings; when thermal expansion forces are combined with the magnetic pull, the problem is amplified. Stator sole plates must withstand frictional effects of thermal expansion and short circuit torques. Present methods used for differential and split phase protection must be improved. Mechanical problems, handling, excitation, and bearing design require special consideration when designing large waterwheel generators. (USBR)

Identifiers: Mineral content.

The suitability of a soil for stabilization, the m appropriate stabilizing agent, and the quantity agent are determined by the chemical a mineralogical compositions and texture of a so Soil classification (based upon physical prop ties), compositional indices, and genetic relati ships are examined to determine their value predicting successful stabilization. Suitability o soil depends upon criteria used to define success stabilization. Specifications often require

inimum unconfined compressive strength when here is little relation between this strength and the erformance of the stabilized soil. Smaller quanti-es of stabilizing agent are required for modifying hysical properties than for achieving the specified trength. Chemical and physical properties do not haracterize soils uniquely with regard to their esponse to cementitious stabilizing agents. Group-g soils in an area according to their origins is a ractical solution. (USBR)

dentifiers: Diffractometers.

ercentages of clay minerals present in 25 complex amples were calculated by 5 different methods sing the same X-ray diffractograms. Significantly ifferent results were obtained by the various ethods. Diffuiculties in clay mineral studies exist ecause of inherent factors in the clay minerals and variations in sample treatment and preparation methods. No preference is given to any one calculation technique because each is as well founded as any other. Preparation methods do not appear sufficiently well developed to produce accurate results. Standard samples containing well-crystallized minerals may cause preferential enrichment of certain minerals not generally found in natural mixtures. A unified methodology should be adopted so that semiquantitative clay mineral analyses may be used for comparisons. Until methodological standardization is achieved, reported analyses should include peak area measurements so that comparisons can be made after suitable recalculations. Without standardized sample treatment, preparation, and calculation methods, regional studies will remain incomparable and objectivity in the quantitative approach to geology may be hindered.

8F. Concrete

EXPERIENCE IN DESIGNING THE PRECAST REINFORCED CONCRETE BUILDING FOR THE SARATOV HYDROELECTRIC POWER-PLANT,
A. K. Vakhrameev, V. N. Rudakov, and L. V. Baikova.
Gidrotekh Stroit, No 4, p 10-14, 1966. Transl from Russ, Bur Reclam Transl 704, June 1969. 21 p, 9 fig, 1 tab.

Descriptors: Foreign projects, *Precast concrete, Reinforced concrete, *Concrete technology, Hydraulic structures, Concrete structures, Costs, Hoisting machinery, Manufacturing, Erection, Joints, Foreign design practices, Cost comparisons, Draft tubes, Continuous structures, Joint fillers, Formwork (Construction), Welding, Reinforcement.
Identifiers: USSR, Saratov powerplant, USSR, Construction methods, Reinforcement cages.

The design and construction experience gained by Soviet builders at Saratov Hydroelectric Powerplant is summarized. The large-size precast reinforced-concrete elements used in erecting the underwater parts of the unique structure are feasible and competitive in cost. The main problem in constructing continuous, well-bonded joints to make the structure monolithic, watertight, and equal in strength to monolithic concrete has been solved. Large curvilinear parts can be manufactured satisfactorily in large-size elements on a conveyor line. Metal reinforcement cages for constructing elements without permanent forms had to meet the requirements of manufacturing, 3-dimensional rigidity, symmetrical placement of electrogrids for internal electroheating without too close proximity to reinforcement rods, and free clearance for lowering groups of 12 vibrators between rods and grids to compact the concrete mix. Several changes were made for keeping pier and floorbeam elements in place so that the concrete mix could be placed in the joint area and compacted by vibrators. Care in manufacturing the components resulted in easier and more economical erection. (USBR)

HOT-THERMOS METHOD OF CONCRETING,
Ia Besser.
Stroit, No 10, p 11-12, 1968. Transl from Russ, Bur Reclam Transl 533, Mar 1969. 6 p, 2 fig, 1 ref.

Descriptors: *Concrete technology, *Cold weather construction, Methodology, Concrete placing, Curing, *Heat treatment, Freezing, Heaters, Foreign construction, Calcium chloride, *Concrete construction, Concrete additives, Concrete mixes, Construction.
Identifiers: USSR, *Thermos method, Cold climates, Electroheating, Concrete properties.

The distinguishing part of the hot-thermos method of concreting is that the concrete mix, prepared from cold ingredients, is delivered to the concreting site and heated just before placement. Electroheating is accomplished in a 0.9-cu m tilting bin. Heating the mix to 70 deg C requires 10 to 15 min at 380 v and 120 to 150 kw. A 121-v source can be used when 1 to 1.5% sodium chloride is added, lowering the unit electrical resistance of the mix by about 2 to 3 times, and requiring 25 to 50 kw of power to heat the mix to 50 deg C in 20 min. A cycle including connecting and disconnecting electrical leads requires approximately 45 min. Using staggered operation of 2 bins and a 1.6-cu m dump truck, about 15 cu m of concrete can be produced per shift. If a grade of portland cement that produces concrete with a minimum compressive strength of 400 kg/sq cm is used, the mix attains 50% of design strength by the time it has cooled to zero deg C. The hot-thermos method reduced the cost per cu m of monolithic concrete by 3.5 to 5.5 rubles ($3.88-$6.10) over the cost of electroheating by the rod-electrode method. (USBR)
W69-09517

THERMAL TREATMENT OF HUGE PRECAST COMPONENTS FOR SARATOV HYDROELECTRIC POWERPLANT STRUCTURES,
N. V. Iudina.
Gidrotekh Stroit No 4, p 14-21, 1966. Transl from Russ, Bur Reclam Transl 705, Apr 1969. 28 p, 8 fig, 1 tab, 5 ref, 1 photo.

Descriptors: *Precast concrete, Reinforced concrete, *Concrete technology, Concrete structures, Strain, Foreign design practices, Freeze-thaw tests, Thermal stress, Concrete testing, *Electrodes, Heat flow, *Heat treatment, Cracking, *Cooling, Elasticity modulus, Creep, Quality control, Cold weather construction.
Identifiers: USSR, Foreign testing, Sratov powerplant, USSR, Precast concrete forms, *Electroheating, Temperature rise, Concrete properties.

Prior to inaugurating the assembly-line method of constructing huge precast reinforced-concrete components for Saratov Powerplant structures, field and theoretical investigations were made to determine the best method of heat-curing the 60- to 80-cu m components rapidly enough to permit unmolding at 10 to 12% design strength and erection at 60% without reducing quality or slowing flow of finished products to the erection site. Full-size specimens were tested by uniform periphery heating to 50 and 80 deg C and electrode-grid internal heating to 80 deg C. Internal electroheating, using the conductivity of the mix to raise the temperature of the specimen at the required rate, prevented surface cracking. Timing and temperatures of electroheating, cooling and moisture-curing cycles must be rigidly controlled to allow the concrete to attain full strength and frost resistance. Properties of the concrete in the specimens, variously treated and cured, were determined by testing cores drilled at different ages. Procedures for manufacturing massive components in summer and winter, the method of installing the electrode grids, and the tests leading to the recommendations are described. (USBR)

PRESTRESSED CONCRETE PILES,
Pomeroy (J. H.) and Co., Inc., San Francisco, Calif.; and Gerwick (Ben C.) Co., San Francisco, Calif.
Ben C. Gerwick, Jr.
J Prestressed Concr Inst, Vol 13, No 5, pp 66-93, Oct 1968. 28 p, 8 fig, 44 ref.

Descriptors: *Prestressed concrete, Pile bearing capacities, *Concrete piles, Bibliographies, Pile driving, *Pile foundations, Bending moments, Pile friction, Pile lateral loads, *Piles (Foundations), Friction piles, Sheet piling, Durability, Bearing piles, Cracking, Design, Ultimate loads, Foundations.
Identifiers: Splicing, Ultimate strength, Lightweight concretes, Pile caps, Pretensioning.

Prestressed concrete piles are employed extensively in marine structures and foundations. Advantages are strength in bearing and bending, durability, and economy. This report is a discussion of a state-of-the-art presentation on prestressed piling as used throughout the world. The field is discussed under the following headings: utilization, design, manufacture, installation, economy, sheet piling, fender piles, splices, problems and failures, durability, and research and development. The annual consumption of prestressed concrete piling is approximately 187 million ft. Prestressed concrete piles have been constructed in the cylindrical form up to 13.1 ft in diameter (Oosterschelde Bridge, Netherlands) and up to 230 ft long (offshore platforms in the Gulf of Maracaibo, Venezuela). In some parts of the U S, there is a trend toward using single long lengths without splices. Piles 131 ft long have been installed for major buildings in San Francisco and Boston. In other areas of the U. S. and other countries, the trend is toward the manufacture of standardized segments, spliced during driving. (USBR)

8G. Materials

FRICTION WEAR AND LUBRICATION,
Cambridge Univ. (England).
Michael J. Furey.
Ind Eng Chem, Vol 61, No 3, p 12-29, Mar 1969. 18 p, 12 fig, 2 tab, 67 ref.

Descriptors: *Friction, *Lubrication, Additives, Technology, Theory, Viscosity, Temperature, Pressure, Bibliographies, Foreign research, Physics, Roughness, Lubricants, Heat, Oil, Greases, Maintenance, Operation and maintenance, Power operation and maintenance.
Identifiers: Friction coefficient (Mech), *Wear, Great Britain, Roughness projections.

The study of friction, wear, and lubrication is approached as an important part of the broader subject of the solid-solid interface. Some special problems in studying solid-solid contact under static and dynamic conditions, and the theoretical and experimental approaches used are discussed. Not enough is known about the detailed conditions existing between rubbing solid surfaces, such as frequency of contact, surface temperatures, pressures, and shear rates. Examples of direct and indirect attempts to measure these conditions include a variety of studies in a high-contact stress, sliding system--a fixed ball on a rotating cylinder. Contact devices and radiotracer techniques have provided additional information on the function of antiwear and antifriction additives in boundary lubrication. Measurements of surface temperatures, using the dynamic thermocouple method, are described. Emphasis has been placed on the more fundamental aspects of solid-solid contact and on recent work in the field of boundary lubrication, the area in which physics and chemistry play important parts. (USBR)

10. SCIENTIFIC AND TECHNICAL INFORMATION

THE IDENTIFICATION AND CRITICAL ANALYSIS OF SELECTED LITERATURE DEALING WITH THE RECREATIONAL ASPECTS OF WATER RESOURCES USE, PLANNING, AND DEVELOPMENT,
Illinois Univ., Urbana. Water Resources Center.
Robert B. Ditton.
Research Report No 23, Water Resources Center, University of Illinois, June 1969. 293 p, 3 tab, 809 ref. OWRR Project A-025-ILL.

Descriptors: *Recreation, Recreation dema
Water quality, Attitudes, Behavior, *Planni
Hydrology, Legal aspects, Water quality contr
Water pollution effects, Research and devel
ment, Reviews, Bibliographies, Documentati
*Information retrieval.

This study integrates and summarizes the high
fragmented, interdisciplinary body of knowled
dealing with recreation and water. Over
thousand publications were identified, do
mented, and classified according to keywo
descriptors. A topical computerized bibliograp
retrieval routine was developed. Using this retrie
system, the project surveyed and critically analyz
research findings and their implications for wa
recreation planning and development. The nar
tive critical analysis of pertinent literature is
ganized within five broad areas: (1) the wa
resource, (2) water resource recreation planni
(3) user-resource planning considerations, (4) fa
tors inhibiting the recreational use of wa
resources, and (5) maintaining water quality
recreational use. In citing gaps in existing metho
and knowledge, this critical analysis forms
bibliographic foundation for a programatic identi
cation of interdisciplinary recreation-wa
resources research needs. These research needs
grouped according to: (1) the water resource,
user-resource planning, (3) water quality ma
tenance for recreational use. An extensive biblio
raphy is included. (Betchart-Univ of Ill)

stitutes, Information exchange, Technical societi

A study was made of the nature and effectiven
of the present procedures used by the Office
Water Resources Research of the United Sta
Department of the Interior and the 51 State Wa
Resources Research Institutes to obtain inform
tion on problems requiring research and to d
seminate the results of research projects. A surv
conducted among heads of water development a
water quality control agencies in every state, o
cials of water departments or utilities in ma
American cities, and selected consulting engine
ing firms throughout the country specializing
water matters revealed that the research inform
tion exchange systems of OWRR and the State
stitutes have not been effective. Only 49% of the
potential users were able to name a water resear
project sponsored by OWRR in their home sta
only 21% were able to name an OWRR sponsor
project in some other state, and only 14% were ab
to name an OWRR research project, the result
which they had used in their work. More than ha
53%, of the potential users felt that there we
problems which required study, which were n
being investigated. The report contains a reco
mended research information exchange system
overcome the demonstrated deficiencies of the e
isting systems. In the recommended system, the
formation gathering and dissemination activities
OWRR and the State Institutes would be bet
defined and would be expanded, and use would
made of the capabilities of Federal information d
semination services, Professional Societies, a
other communication media.
